

Why Enterprises Should Opt for Open Source DevOps Tools

The need to develop software and applications more efficiently, to save redundancy, shorten time to market, and improve reliability and speed, has spawned the DevOps project. Traditionally developed apps are not adaptable to the rapid and sweeping changes engulfing the IT arena. DevOps provides a way to overcome these obstacles. And DevOps powered by open source is a formidable combination.

DevOps comprises a set of methods, cultural changes, practices, organisational structures and tools that increase the ability to deliver applications at high velocity to clients. Organisations that adopt DevOps are more easily able to release and monitor next-generation applications. It helps in responding to new requirements quickly and to the problems that occur in production. This speed enables organisations to better serve their customers and compete more effectively in the market.

DevOps aims at unifying the software development and software operation processes. The emphasis is on people and culture — to improve collaboration between the development and operations groups. Having said that, let us look at what DevOps is not:
