

- Reduce cost and time to delivery – they can be deployed often, faster and with repeatable, reliable processes
- Improve development productivity and overall quality by 20 per cent with automated and early detection of defects in the cycle
- Improved code coverage, from 30 per cent to 95 per cent
- Reduce regression cycle time from months to days
- Improved quality – automated testing reduces cost and time to test
- Increased service quality, reliability and the use of virtualised environments
- Reduced defective cycle time

DevOps tools shorten the time-to-market and improve quality. The DevOps toolchain improves productivity, time to market and reduces risks, facilitating collaboration between the product team, the IT development resources and operations staff through all the stages of the software development life cycle for seamless communication.

Just deploying the right set of tools to the right users will not serve the purpose, however. Proper connectivity between and across the DevOps toolchain is necessary to create a collaborative work environment for the development and operations teams. An integrated tools system saves considerable time and effort compared to manual processes.

If enterprises are looking to build enterprise DevOps toolsets, they should consider open source DevOps tools in addition to commercial tools. **END** 🐧
