

Installation and configuration of Portainer.io on Ubuntu Linux 16.04 LTS is as follows:

```
shashi@ubuntu~}$ lsb_release -a
LSB Version:    core-9.20160110ubuntu0.2-amd64;core-
9.20160110ubuntu0.2-noarch;security-9.20160110ubuntu0.2-
amd64;security-9.20160110ubuntu0.2-noarch
Distributor ID: Ubuntu
Description:    Ubuntu 16.04.4 LTS
Release:        16.04
Codename:       xenial
```

```
shashi@ubuntu~}$ docker volume create portainer_data
shashi@ubuntu~}$ docker run -d -p 9000:9000 -v /var/run/
docker.sock:/var/run/docker.sock -v portainer_data:/data
portainer/portainer
```

Once the complete installation is done, the IP of the respective host or Docker can be used and Port 9000 of the Docker engine can be used to access Portainer from the browser (<https://<ip Address>:9000>). You will get the screen shown in Figure 2.

Note: Please make sure that you enter 8-character passwords. Let the admin be the user as it is, and then click on 'Create user'. The screen shown in Figure 3 appears now; so select the 'Local' rectangular box.

Click on 'Connect'. A nice GUI, with the admin as the user home screen appears (Figure 4).

Now Portainer is ready for monitoring.

Home: This page displays the endpoints, and various containers that are active and in running status.

Settings: This page is sub-divided into the following sections:

```
$ docker volume create portainer_data
portainer_data
$ docker run -d -p 9000:9000 -v /var/run/docker.sock:/var/run/docker.sock -v portainer_data:/data
/portainer

- **Extensions** – To extend the benefit of Portainer CE even more, and to address the needs of larger, complex or critical environments, the Portainer team provides a growing range of low cost extensions. Portainer extensions provide a simple way to enhance Portainer CE's core functionality through incremental capabilities in important areas.
- **Users** – This page is for complete user management like adding/deleting users along with login privileges.
- **Endpoints** – This page is for managing endpoints.
- **Registries** – This page is for registries management (Dockerhub as well as local).
- **Settings** – This page is for application settings, snapshotting (with intervals), managing mount points, etc. The series of screenshots in Figures 5 through 9 display these various options in detail.
