Bringing up a container image on Portainer tool

If the containers shown in Figure 10 are clicked on, the container monitoring page opens up.

Next, the window shown in Figure 11 appears with various options.

Now check the present status – there is one container image that is already running, and if you create one more, that appears instantly.

From your command line, kickstart one or two containers

Figure 10: Container monitoring

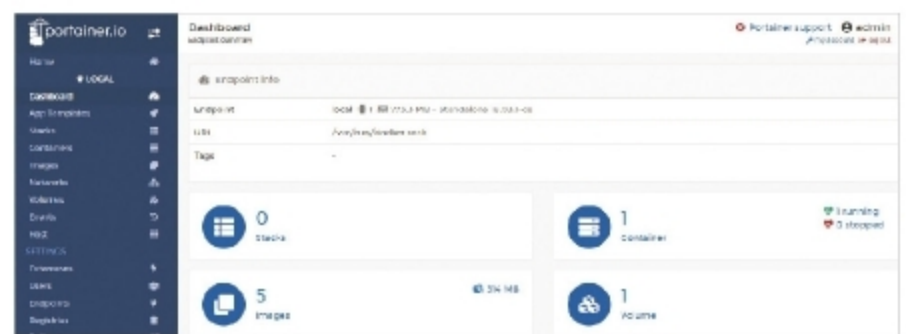

Figure 11: Dashboard

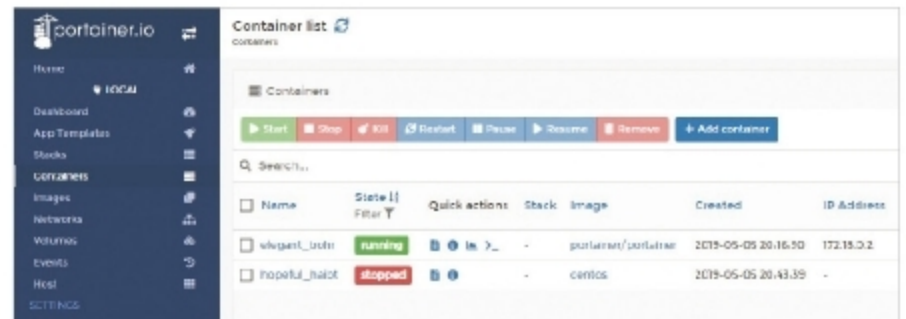

Figure 12: Container list

as shown below:

```
shashi@ubuntu~}$ docker container run centos
Unable to find image 'centos:latest' locally
latest: Pulling from library/centos
8ba884070f61: Pull complete
Digest: sha256:8d487d68857f5bc9595793279b33d082b03713341ddec9
1054382641d14db861
Status: Downloaded newer image for centos:latest
```

All the other options inside the dashboard or local window – like stacks, containers, images, networks, volumes, events and hosts – can be explored further for more detailed monitoring and control of container images. You can go to <https://www.portainer.io/overview/> for more details on the usage of these features.

Portainer.io is gaining popularity in the Docker community as one of the most used and best tools. As it comes equipped with a lot of options and features for monitoring, building and managing Docker containers, usage and adoption of this tool has become the *de facto* standard. One can choose the appropriate version of Portainer based on the requirements. **END** 🐧
