

An Overview of H2O: An Open Source AI Platform

According to the H2O official website, “H2O.ai is the creator of the leading open source machine learning and artificial intelligence platform trusted by hundreds of thousands of data scientists, driving value in over 18,000 enterprises globally. Our vision is to democratise intelligence for everyone with our award winning ‘AI to do AI’ data science platforms.”

H2O is a machine learning platform with linear scalability, is distributed and a leading open source enterprise. H2O strengthens the widely used machine learning and statistical algorithms comprising deep learning, generalised linear models and gradient boosted machines. The leading AutoML functionality in H2O automates all the hyper boundaries and algorithms to produce the best supermodel. The platform is extremely popular in both the R and Python communities and globally, it is used by over 18,000 consortiums.

The essential traits of H2O

Listed below are some of the key features of this platform.

Superior algorithms: The algorithms have evolved from both supervised and unsupervised approaches and are for distributed computing. They cover GLRM, Word2Vec, Random Forest, XGBoost, GBM, GLM, and many more.

The approach from Python, R and Flow:

Programming languages like Python, R and other models are used to build H2O. The interactive graphical user interface doesn't need any coding.

AutoML (New): H2O AutoML automates the training and tuning of many machine learning models within a prescribed user time limit.

In-memory and distributed processing: In-memory processing manages fast serialisation to support massive data sets between clusters and nodes. Distributed processing on big data accelerates to 100x quicker with fine-grain parallelism, empowering ideal productivity without presenting degradation in computational precision.

Simple deployment: Easy-to-locate plain old Java objects and model objects, that are optimised to send models for quick and exact scoring in any condition, including vast models.
