

2020, subject to the satisfaction of customary closing conditions.

“Realm is incredibly popular with mobile developers because it makes it easy for them to work with data to accelerate innovation, which is very consistent with our own philosophy,” said Dev Ittycheria, president and CEO, MongoDB.

“This acquisition is a natural fit for our global cloud database, MongoDB Atlas, as well as a complement to Stitch, our serverless platform. We look forward to working closely with Realm’s strong engineering talent and the vibrant developer community to capture an additional share in the database market by giving developers a far more flexible, intuitive and comprehensive way to work with mobile data,” Ittycheria added.

Eliot Horowitz, CTO and co-founder, MongoDB, wrote in a blog post that the companies are working on crafting their shared roadmap and will be announcing details at the MongoDB World customer conference to be held from June 17-19, 2019, in New York City.

There are more than 100,000 active developers using Realm, and the solution has been downloaded more than 2 billion times.

“MongoDB’s guiding mission is to make working with data incredibly easy for developers,” said David Ratner, CEO, Realm. “We believe this is the perfect marriage so we can continue doing what we started Realm for – helping mobile developers build better apps faster, and helping both the community and enterprises support their use cases across offline-first requirements, digital transformation, user experience and IoT. Together, we will work to deliver innovative solutions from the cloud to the edge, providing highly responsive user interfaces and experiences to an even larger community of mobile developers,” he asserted.

Databricks launches new open source project to make data lakes more reliable

Databricks, the company founded by the original creators of Apache Spark, has announced a new open source project called Delta Lake, to deliver reliability to data lakes.

According to the company, Delta Lake is the first production-ready open source technology to provide data lake reliability for both batch and streaming

data. This new open source project, Databricks said, will enable organisations to transform their existing messy data lakes into clean Delta Lakes with high quality data, thereby accelerating their data and machine learning initiatives.

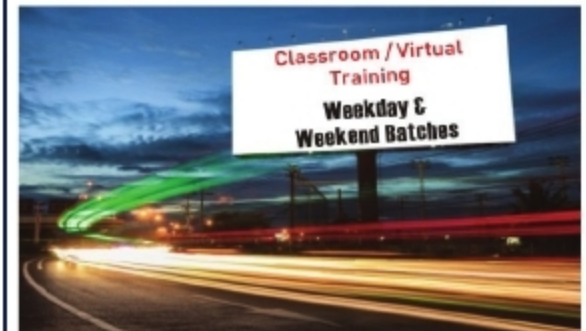

Unreliable data in data lakes prevents organisations from deriving business insights quickly and significantly slows down strategic machine learning initiatives. Data reliability challenges derive from failed writes, schema mismatches and data inconsistencies when mixing batch and streaming data and supporting multiple writers and readers simultaneously.

“Today, nearly every company has a data lake that it is trying to gain insights from, but data lakes have proven to lack data reliability. Delta Lake has eliminated these challenges for hundreds of enterprises. By making Delta Lake open source, developers will be able to easily build reliable data lakes and turn them into ‘Delta Lakes’,” said Ali Ghodsi, co-founder and CEO at Databricks.

Delta Lake will deliver reliability by managing transactions across streaming and batch data, and across multiple simultaneous readers and writers. It can be
