

better. Further, Red Hat customers can influence roadmaps based on their business needs.

Customers value the open source ethos of transparency, community and collaboration, and we help them consume the innovation of open source-developed software. We are using our newly launched Red Hat Open Innovation Labs to take our knowledge and experience directly to our customers. The lab can be accessed by way of a residency, or as a virtual or pop-up setting, where Red Hat consultants, engineers and subject matter experts (SME) collaborate and work closely with customers to modernise existing applications. They might also create new ones using open source and DevOps.

Q Can you elaborate on Red Hat's community-powered approach to providing reliable and high-performing solutions?

For Red Hat, open source is the way of life. We are on a mission to be the catalyst in communities of customers, contributors and partners to develop better technologies using open source. We contribute to communities that are changing the landscape of technology—from the operating system and developer toolchain to middleware, the desktop and the cloud. Many individual Red Hatters participate in projects that interest them, and our development teams contribute code to many upstream projects. Red Hat's participation provides open source projects with expertise

and infrastructure that strengthens these projects. Our most well-known community involvement is with Fedora and CentOS. We're also very active in the JBoss developer community, which is where numerous application server and middleware projects reside.

Likewise, there are several other community projects. These projects are the technology foundation of Red Hat's commercial products. We acquire various open and closed source technologies, make them enterprise ready and give the code back to the community. Through its work in open source communities, Red Hat maintains strong relationships with customers, developers and partners across the IT industry, including organisations that compete with Red Hat. **END**
