

The Future Of Present Technologies

Here's a brief look at how today's technologies will impact our lives in the near future.

Technology is transforming the way we learn, work, play and live. Technological advancements in communication make it possible for us to communicate irrespective of location and ability. Technology has its branches and necessary aids for each one of us, for our every need, irrespective of the industry or market. Industries need to take advantage of recent technologies to reach global markets and to make services available to a broad range of users.

Technology is driving innovation and empowering organisations in their digital transformation journey. It is helping companies transform their operations and business models. External partnerships can open new markets for platforms and products, and also help companies overcome traditional barriers of expansion and scale with the help of core competencies that each partner possesses. Let's take a quick look at a few current

technologies poised to become world changers in the year 2019 and beyond.

Blockchain technology

As more and more people are getting connected, identity and privacy protection have become a concern. Blockchain is an incredibly strong distributed data ledger, information within which is encrypted to keep it safe. It is stored across a huge network and, hence, there is no central point of failure.

Blockchain and biometrics provide a robust way to secure and manage user identities through an incorruptible and encrypted method of record keeping that is easily verifiable. So it is likely to play an important role in establishing secure data records.

Companies have applied blockchain technology to everything from tracking and accessing information in academia, to games that use complex algorithms to

create unique experiences. After finding its successful application in almost every field—finance, agriculture and geospatial areas, among others—it is now revolutionising the energy sector. Its full potential can be used to keep our votes secure, in addition to keeping our transactions and data secure. By 2020, the world will see mass adoption of blockchain due to its advanced cryptography and ciphering techniques.

Artificial intelligence and machine learning

These technologies are part of the intelligence behind machines, and are rapidly transforming the digital era. These have wide applications in emerging technologies like augmented reality (AR)/virtual reality (VR), cloud computing, robotics, face recognition, chatbots and so on. Artificial intelligence (AI) has found applications
