

`var` is permitted only for the formal parameters of an implicitly typed lambda expression.

2. **Single file source code programs:** For the simple 'Hello World' application, we need to write about six to ten lines of code. To simplify this process, JDK 11 has come up with the single file launch of source code. That means it eliminates the need to compile a single file application and directly runs them for results. In source file mode, the source file is compiled into memory, and the first class found in the source file is executed. For example, if a file called *HelloWorld.java* contains a class called *HelloWorld*, then the command:

```
java HelloWorld.java
```

...is equivalent to:

```
javac HelloWorld.java
java HelloWorld
```

3. **HTTP client (standard):** JDK 9 introduced a new API to provide support for the HTTP client protocol as the incubator module. This feature is an enhancement to the HTTP API of JDK 9 and now is part of JDK 11, which is completely

asynchronous. The flow of data can now be more easily traced, from the user level request publishers and response subscribers all the way down to the underlying socket.

4. **Removal of the Java EE and CORBA modules:** This removal requires applications to explicitly depend upon Java EE and CORBA modules if required. Applications will have no connection to Web Services or XML but rely on individual classes in the Java EE APIs for general-purpose functionality.
5. **New APIs:** Many new APIs have been added in this version of the JDK, including the HTTP client and flight recorder. Major changes have been done in *java.io*, *java.lang*, *java.nio*, *java.util*, and many more.

These are some of the exciting changes in JDK 11, which is available for download from Oracle's official site. You can download either OpenJDK or OracleJDK, depending on your requirements.

JDK 12 will be the next LTS release of the JDK (as defined by Oracle). Stay tuned for more such updates on Java. **END** 🐧
