

realise that money and value transfers could be reinvented with Internet based technologies. Internet protocols enable information to be packeted, routed and delivered over communication networks. With ILP, money and other forms of value can be packeted, routed and delivered over payment networks and ledgers.

Hyperledger Quilt

Hyperledger Quilt started out around 18 months ago and is a Java implementation of the Interledger Protocol. Hyperledger Quilt offers interoperability between ledger systems by implementing ILP, which is primarily a payments protocol and is designed to transfer value across systems – both distributed ledgers and non-distributed ledgers. It is a simple protocol that establishes a global name space for accounts, as well as a protocol for synchronised atomic swaps between different systems.

Hyperledger Quilt is an enterprise grade implementation of the protocol, developed in Java and providing libraries and reference implementations of the core interledger components and timely ledger integrations for other Hyperledger projects.

Technical details of Quilt

The aim of those behind the project was that Quilt should become a ledger interoperability solution for Hyperledger projects. This will enable Hyperledger members' distributed ledger solutions, financial institutions' private ledgers, IoT companies' wallets, and supply chain systems to connect with one another to perform distributed atomic transactions.

By implementing the Interledger protocol, Quilt

provides the following:

- A set of rules for enabling ledger interoperability with basic escrow semantics.
- A standard for a ledger-independent address format and data packet format that will enable connectors to route payments.
- A framework for designing higher level use-case-specific protocols.

Getting started with Quilt

Quilt is an exciting addition for the Hyperledger community. As always, the community encourages developers to join its efforts on Quilt as well as other projects through GitHub [<https://github.com/hyperledger/quilt>], Rocket.Chat, the wiki or the mailing lists. You can also follow Hyperledger on Twitter or address questions to info@hyperledger.org.

The author is an open source enthusiast with experience in blockchain, cloud native solutions, containers and enterprise software product architectures. He has diverse experience working on different private and hybrid cloud architectures with Amazon Web Services, Azure, OpenStack, CloudStack, IBM Cloud, etc. He is a technology hobbyist and writes at cloudnativetech.wordpress.com.

OSFY Magazine Attractions During 2019-20

MONTH	THEME
March 2019	Mobile/Web App Development and Optimisation
April 2019	Cybersecurity, Open Source Firewall, Network Security and Monitoring
May 2019	AI, Deep Learning and Machine Learning
June 2019	DevOps Special
July 2019	Blockchain and Open Source
August 2019	Database Management and Optimisation
September 2019	Open Source and IoT
October 2019	Cloud Special: BigData, Hadoop, PaaS, SaaS, IaaS and Cloud
November 2019	Open Source on Windows
December 2019	Open Source Programming (Languages and Tools)
January 2020	Data Security, Storage and Backup
February 2020	Best in the World of Open Source (Tools and Services)
