If you don't have much knowledge about HTML, CSS, JavaScript or jQuery, there's no need to worry because the Bootstrap framework is easy to learn and use.

New features in the latest version of Bootstrap

There are some new features in the Bootstrap beta version. This version includes some stabilised CSS, a Media Query style and an updated new grid style.

- The giant move to Flexbox:** In Bootstrap v4, Flexbox is enabled with many new, awesome features such as the Flexbox based grid, vertical centring, auto-layout grid, floats, auto margin, responsive sizing and new spacing utilities. Flexbox also powers the new card components.
- Updated grid system:** Bootstrap v4 has been made to take the five-grid tier system, which includes *xs*, *sm*, *md*, *lg* and *xl*. The new grid tier, *xl*, increases the media query range all the way down to 544px.

The improved grid system offers the following:

- Support for Flexbox in the grid mixin and predefined classes.
- Support for horizontal and vertical alignment classes.
- Change in media queries to avoid repeating a query declaration. For example:

```
@include media-breakpoint-up(sm) {}
  @include media-breakpoint-down(sm) {}
  @include media-breakpoint-only(sm) {}
```

- Changed grid mixins from *make-col-span* to *make-col* for a singular mixin.

- Browser support changes:** Bootstrap v4 supports IE10+, the Android v5.0 Lollipop browser and Webview, as well as iOS 7+. But it has dropped the support of IE8, IE9 and iOS 6. If we want to have support for older versions of these browsers, we must use Bootstrap v3.
- Media queries on steroids:** In Bootstrap v4, *@screen* no longer exists. We can now write the media queries very easily, as shown in the following example:

In CSS (Old bootstrap version):

```
// Extra small devices (portrait phones, less than 576px)
// No media query since this is the default in Bootstrap
// Small devices (landscape phones, 576px and up)
@media (min-width: 576px) { ... }
// Medium devices (tablets, 768px and up)
@media (min-width: 768px) { ... }

// Large devices (desktops, 992px and up)
@media (min-width: 992px) { ... }
// Extra large devices (large desktops, 1200px and up)
@media (min-width: 1200px) { ... }
```

In the new version of Bootstrap, media queries such as *media-breakpoint-up()*, *media-breakpoint-down()*, *media-breakpoint-between*, or *media-breakpoint-only()* can be used as shown below:

```
@media (min-width: 576px) and (max-width: 767.98px) { ... }
can be used as @include media-breakpoint-only(sm) { ... }.
@media (min-width: 1200px) { ... } can be used as @include
media-breakpoint-only(xl) { ... }.
@media (max-width: 575.98px) { ... } can be used as @
include media-breakpoint-down(xs) { ... }.
@media (min-width: 576px) { ... } can be used as @include
media-breakpoint-up(xs) { ... }.
```

There are many more changes in Bootstrap v4 as described below.

- Modified form classes based on layout. For example: *.control-label* is now *.col-form-label*; *.input-lg* and *.input-sm* are now *.form-control-lg* and *.form-control-sm*, respectively; *.form-group-** classes are now *.form-control-** classes; *.help-block* is now *.form-text* for block-level help text, etc. Utility classes like *.text-muted* can be used for inline help text, with no more of *.radio-inline* and *.checkbox-inline*, etc.
- Modified new card components with the Flexbox feature. As per the functionality for thumbnails, panels and wells are available as modifier classes for cards. For example: *class="card-body"* which is the building block; *class="card-header"* which gives you a header within a card; *class="card-footer"* which gives you a footer within a card; *class="card-info"*, *class="card-*
