Figure 8: Creating a new project in Corona

To build the app for all platforms, use the following code:

```
E:\nodejs> cordova build
```

To build the app for iOS, use the command given below:

```
E:\nodejs> cordova build ios
```

After building the app, the Android APK file will be saved in the specific folder as depicted in Figure 5.

The generated APK file can be uploaded to the mobile phone for deployment and to test the output on the actual device.

To view the app in the browser, use the code given below:

Figure 9: View the output on the inbuilt mobile emulator of Corona

Figure 10: Using the Corona mobile emulator in Corona SDK

```
E:\nodejs>cordova run browser
```

To add social media plugins for Facebook, Twitter, Instagram, LinkedIn, etc, use the following commands:

```
E:\nodejs>cordova create socialShare
```

```
E:\nodejs>cd socialShare
```

```
E:\nodejs>cordova platform add android
```

```
E:\nodejs>cordova platform add ios
```

```
E:\nodejs>cordova plugin add cordova-plugin-x-socialsharing
```

```
E:\nodejs>cordova prepare
```

With the integration of social media plugins, screens or specific texts can be shared on social platforms with a single click. Different plugins and Web services can be attached for smartphone apps in the way shown here, and these apps can be installed and deployed on any type of platform without any compatibility or performance issues.

Installing and working with Corona to develop cross-platform mobile apps

The following are the prime features and aspects of Corona (<https://coronalabs.com/>), specific to the development of cross-platform mobile apps:

- Free inbuilt simulator
- Cross-platform
- Lua programming
- Aspect oriented
- High number of plugins
- Inbuilt emulator
