

Toggle Lock option. If we click this button, it takes us to the *LoginPage()* as shown in the *Home.dart* file.

```
class LoginPage extends StatefulWidget {
  static String label = "Enter Credentials";
  @override
  _LoginPageState createState() => _LoginPageState();
}
class _LoginPageState extends State<LoginPage> {
  // Login page code goes here
}
```

We have used a *StatefulWidget* here. These widgets are dynamic, and allow us to create widgets that can change their content dynamically over time. They don't have to depend upon the static states which are passed during their instantiation.

These widgets can change due to user input, any form of response or from another form of state change. And ta-dah! We have an app right here.

Although the app works internally in a rather complex fashion, that's because we need it to. Business rules will dictate the internal complexity of the app, but getting to a

Figure 5: Example authentication page

point where the app is usable is very easy with Flutter.

And the same app works for iOS and Android!

With a little effort, arriving at a serious app with Flutter will take much less time than it would in the conventional way. So, what are you going to use Flutter for?

We are excited to see what you build with it. **END** 🐧
