

MyEtherWallet launches new open source Ethereum blockchain explorer tool

MyEtherWallet (MEW), one of the major wallet providers for Ethereum (ETH), has recently announced the launch of its own new, native open source ETH blockchain explorer tool, called EthVM Alpha, as part of its attempt to make blockchain more approachable.

EthVM Alpha will help new users understand the Ethereum network by granting users complete transparency. It will allow users to examine blockchain histories, balances and smart contracts.

Olga Kupchevskaya, VP of MEW, believes that an open source explorer like EthVM Alpha will not only encourage cryptoliteracy among users but advance the ecosystem as a whole by making public blockchain data easily accessible for apps. Since the code is open source, it will promote learning and community collaboration, she said.

Explaining why the tool was needed, Kupchevskaya said, "The explosion of interest in cryptocurrencies in 2017 brought many new players to the blockchain space, but also bewildered many newcomers. What we need are open source blockchain tools that can provide knowledge and resources to this growing community, in order to facilitate healthy technology development."

MEW, however, has also warned that the new version of the EthVM is still in its alpha state, and could be vulnerable to a few bugs and errors that had not been caught by its developing team.

Aldo Borrero, lead developer of EthVM Alpha, said, "Ethereum was built to be an open and a decentralised platform. EthVM Alpha honours the same core principles, and we'd like a global community to help us expand and improve this amazing project."

Since EthVM Alpha is open source, it enables additional features and welcomes community collaboration. It is being considered as a rival for Etherscan.io.

These deals included broad adoption across Red Hat's portfolio of technologies, with cross-selling up 22 per cent from the previous year, said Red Hat's executive VP and CFO, Eric Shander.

Additionally, the company recorded a total backlog of US\$ 4.1 billion, witnessing a 22 per cent increase year-over-year. This is the third consecutive year in which backlog increased at a rate of more than 20 per cent year-over-year, Shander added.

During the fourth quarter of FY 2018-19, Red Hat posted total revenues of US\$ 879 million, up 14 per cent from the same period last year. Subscription revenue for the quarter was US\$ 774 million, up 13 per cent year-over-year. Subscription revenue in the quarter was 88 per cent of total revenue.

The company achieved a total revenue of US\$ 3.4 billion in the full fiscal year of 2018-19, which is 15 per cent more than the previous year. Subscription revenue (88 per cent of total revenue) for the full fiscal year was US\$ 2.9 billion, up 15 per cent year-over-year. Because of the pending transaction with IBM Corporation, Red Hat said it will not be hosting a conference call for its fourth quarter of 2018-19 business results. Also, it will not be providing an outlook for the next fiscal year 2019-20.

Researchers create open source solution to monitor cardiac arrhythmias

An international research team has developed an open source solution for multi-parametric optical mapping of the heart's electrical activity.

The solution could help researchers better understand the mechanisms underlying cardiac arrhythmias and develop an affordable optical mapping system, the team members said.

The 3D models of the mapping system's components and the source code for the data analysis have been made openly available to enable other research groups to benefit from the new solution.

The team includes researchers from the Moscow Institute of Physics and Technology (MIPT) and the George Washington University (GW).

Optical mapping is currently the leading technique to investigate the mechanisms behind arrhythmias. A number of intracellular parameter changes can be tracked this way using high-speed cameras, but the high cost of the equipment and the technical challenges of monitoring multiple parameters at the same time and processing the associated signals have prevented widespread use of optical mapping in the biological community, the researchers said.

The researchers have developed an open source and expandable system that simultaneously tracks cardiac electrical excitation and
