

comparatively new five years ago. Early expectations that Spark might replace Hadoop, as it is significantly faster, did not materialise. They are co-existing nicely together.

ElasticSearch and Solr are the most popular tools for searching. Both have been around for over a decade. I had decided to experiment with ElasticSearch. Solr has the advantage of being an Apache project. Elastic, the company behind ElasticSearch, was in the news recently over a conflict with Amazon Web Services over licensing issues. As the article in Geekwire (<https://goo.gl/BZFTZV>) points out: “The ease with which those open source projects can be offered as revenue-generating cloud services without any obligation to contribute code back to the project has not sat well with several companies, who last year changed the licensing terms of their open source projects to make it harder or impossible for AWS to offer those projects as cloud services.”

HBase is still a significant NoSQL database for Hadoop

There is no dearth of additional tools and frameworks that you can explore. On Apache itself, there are 49 projects under the Big Data category! It is an incomplete list even for Apache. For example, Apache Pig and Apache HBase are in the database category.

So what would I like to add to the ‘list to learn’? Two interesting core areas appear to be:

- Kafka for messaging and stream processing
- Mahout for machine learning

There is no shortage of software to learn, only the constraints of time! **END** 🐧
