

Drupal addresses two critical remote code execution vulnerabilities

In its new patch, Drupal has corrected critical remote code execution vulnerabilities that would have allowed attackers to exploit Drupal CMS installations with versions prior to 7.6.0, 8.6.2 and 8.5.8. Unpatched versions of Drupal's open source content management system (CMS) are vulnerable to remote exploitation, which could lead to remote code execution.

The maintenance and security release of Drupal fixes security vulnerabilities. Sites are urged to upgrade immediately after reading the notes.

Considering the sufficient privileges associated with the user under which the Drupal installation is running, this could allow the hackers to create new accounts with full user rights, as well as see, change and delete data on the compromised system. Therefore, compromised servers where Drupal is running with a user account with limited rights will be much less affected than those where Drupal is running with an administrator account.

The remote code execution vulnerability exists within Drupal's default mail system due to incorrect sanitisation of the shell arguments, which could result in a completely compromised website.

The first critical vulnerability resided in the mail component `DefaultMailSystem::mail()` of Drupal and leads to RCE when the emails sent contain variables that were not sanitised for the shell arguments.

The second critical security problem patched by Drupal was present in the contextual links module that did not validate the requested contextual links sufficiently.

This vulnerability is mitigated by the fact that an attacker must have a role with the 'access to contextual links' permission, according to the Drupal SA-CORE-2018-006 security warning.

Drupal also corrected three other security errors that could have led to access, open redirection and anonymous open redirect conditions.

"With iModel.js, the well-refined techniques of mainstream cloud and Web development can leverage the physical and virtual reality in digital twins with near-zero impedance. By open sourcing the libraries we use to create our iTwin cloud services, we expect to foster a substantial and vibrant ecosystem of innovation," he added.

The latest iModel.js library is a vast collection of JavaScript packages that have been developed on the most popular, open and flexible standards for Web development and the modern cloud. The library is written in TypeScript programming language, and leverages open technologies such as SQLite, NPM, Node.js, WebGL, Docker, Electron, Kubernetes, and HTML5 and CSS. The similar codebase can create cloud solutions and mobile, Web and desktop applications. The source code of the open source library is hosted on GitHub and is distributed under the MIT licence.

With the latest iModel.js, it is easy to create a Web based experience which displays interactive 'nD' views like 1D, 2D, 3D, 4D, etc, of iModels that are synchronised and assembled from BIM files and various other digital engineering models, and from data directly created with iModel.js.

Liferay acquires controlling interest in Triblio

Liferay Inc., which makes software that helps companies create digital experiences on the Web, mobile and connected devices, has announced that it has acquired the controlling interest in Triblio and is committed to ongoing strategic investments to grow Triblio's account-based marketing (ABM) business. The investment allows Liferay to explore opportunities for the DXP audience to further enhance and personalise the customer journey with account-specific content and messaging. In turn, Triblio will continue to focus on delivering long term customer value and product innovation.

"Triblio represents the next generation of the B2B marketing cloud, and we are fully committed to investing in the platform and growing Triblio's ABM business," said Liferay CEO Bryan Cheung.

"Existing Liferay DXP customers will reap the benefits of this investment over time as we continue to help organisations build long term relationships and deliver value to customers across their life cycle," Cheung added.

A brand new version of Ubuntu is out

On October 18, Canonical released Ubuntu 18.10, the latest version of the Linux based operating system, including all the latest GNU/Linux technologies and open source software.

Code named Cosmic Cuttlefish, Ubuntu 18.10 has been under development for the last six months and has received numerous improvements over its previous releases. Ubuntu 18.10 has the latest desktop, GNOME 3.30, and

is powered by the latest Linux 4.18 kernel.

The latest release will be supported by Canonical over the next nine months with software updates and security fixes. It is available for download as Ubuntu Desktop, Ubuntu Server, Kubuntu, Xubuntu, Lubuntu, Ubuntu MATE, Ubuntu Budgie, Ubuntu Kylin and Ubuntu Studio Tastes.
