

Email security platform Proxmox Mail Gateway 5.1 released

Proxmox Server Solutions GmbH has released version 5.1 of its open source email security platform. Proxmox Mail Gateway is based on Debian Stretch 9.5 with a 4.15 kernel and is a complete operating system. Proxmox Mail Gateway 5.1 comes with enhanced features such as an antispam and antivirus filtering solution, which works as a full-featured mail proxy deployed between the internal mail server and the firewall. The advance feature 5.1 version of Mail Gateway shields organisations against spam, viruses, Trojans and phishing emails.

Proxmox Mail Gateway 5.1 comes with some new features, bug fixes and GUI improvements. The improvements include certificate-based authentication where encrypted sessions are provided by the new Transport Layer Security (TLS) policy. With this feature, users can set a different TLS policy according to the destination domain if they want to prevent the e-mail delivery without encryption or to work around a broken STARTTLS ESMTP implementation. The TLS policy can also be configured by using the GUI, and TLS is also possible on internal SMTP port/traffic.

The new updated user management system allows a new helpdesk role, enabling helpdesk staff to examine the quarantine. The 5.1 version of Proxmox Mail Gateway supports SMTPUTF8, and this can fix the problem of some undelivered Google mails.

Some keyboard shortcuts (for 'Whitelist', 'Blacklist' and 'Delete') have been added by Proxmox developers to improve the 'Spam Quarantine' on the Web based user interface. This allows the contextual menus with a right-click and enables multi-selection of emails. Proxmox Mail Gateway 5.1 has optimised graphs and reports in the GUI. It has been launched under the GNU Affero GPL, v3. You can avail it as a bare-metal ISO install with an installation wizard that automatically configures all the necessary components on the host, eliminating the need for any manual setting up.

Proxmox offers a subscription based support model with access to the stable enterprise repository and to technical support. The starting subscription price is US\$ 114.15 (Euro 99) per host and per year for an unlimited number of users. One subscription provides access to the enterprise package repository, whereby users can get regular updates via the Web based user interface and this is recommended for production use.

Bentley Systems releases iModel.js, an open source library

Bentley Systems, a global leader in comprehensive software solutions for advancing the design and operations of infrastructure and construction, has announced the release of its iModel.js library. This is an open source initiative for improving accessibility, for visualisation as well as analytical visibility of infrastructure digital twins.

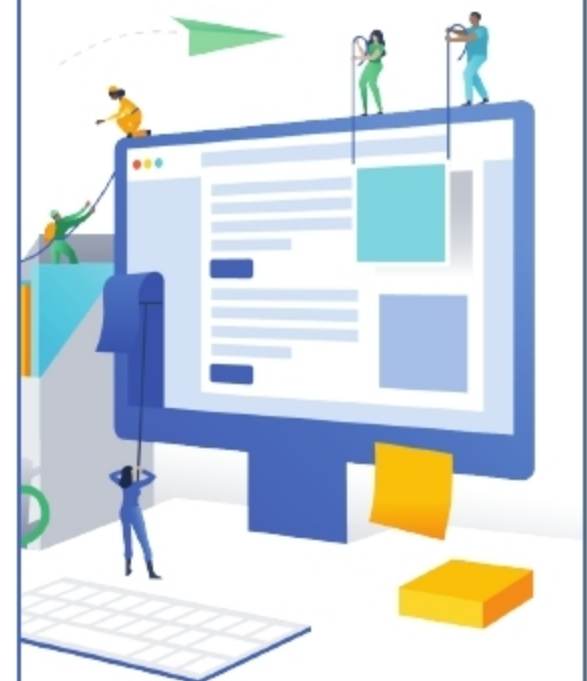

iModel.js library can be used by IT professionals and developers to easily and quickly develop immersive applications that connect their infrastructure digital twins with the rest of the digital world. The open source initiative is the basis of the company's recently announced iTwin Services, which combine iModelHub, reality modelling software, and Web-enabling software technology within the Connected Data Environment (CDE) for infrastructure engineering.

"Bentley's iModels have become a *de facto* standard for visibility into digital engineering models. iModelHub manages an iModel as a distributed database with an intrinsic ledger of changes – enabling alignment, accountability and accessibility of its digital components – to form the backbone of an infrastructure digital twin," according to the company's press release.

Commenting on the development, Keith Bentley, founder and CTO, Bentley Systems, said, "We firmly believe that iModel.js, and of course the foundation upon which it is built, is the most open, productive, intuitive and powerful development environment for capital projects and infrastructure assets, ever."
