

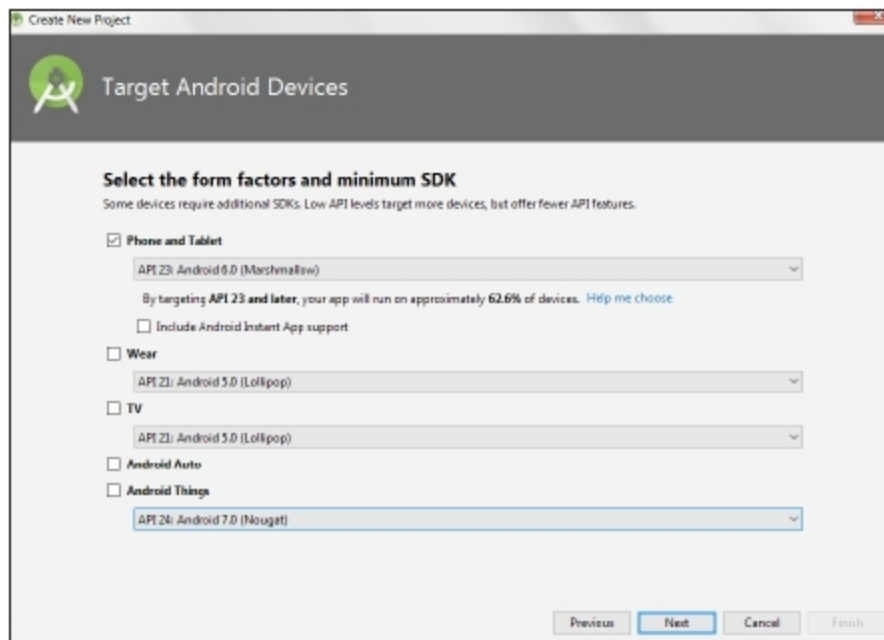

Figure 7: Target Android devices

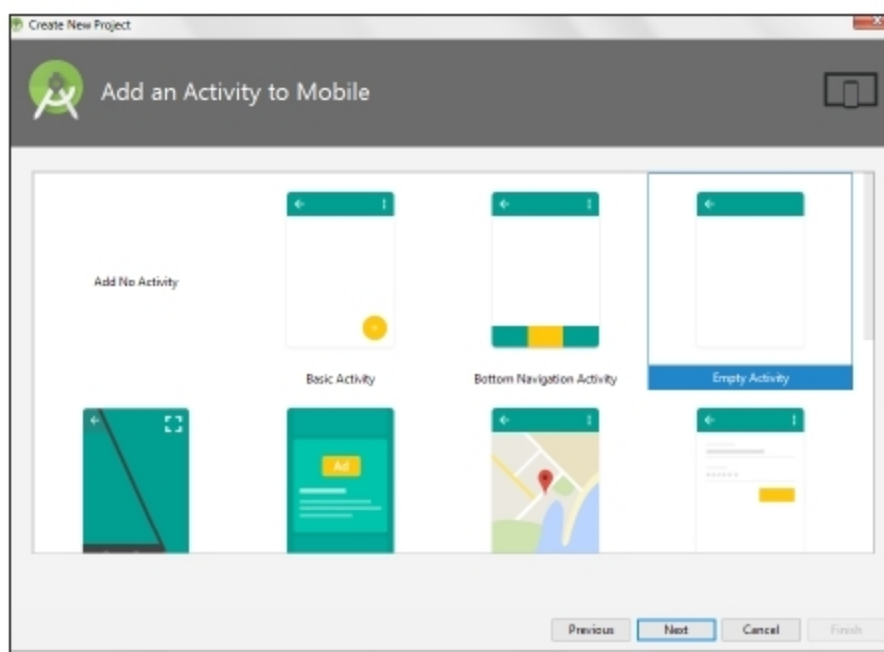

Figure 8: Activity

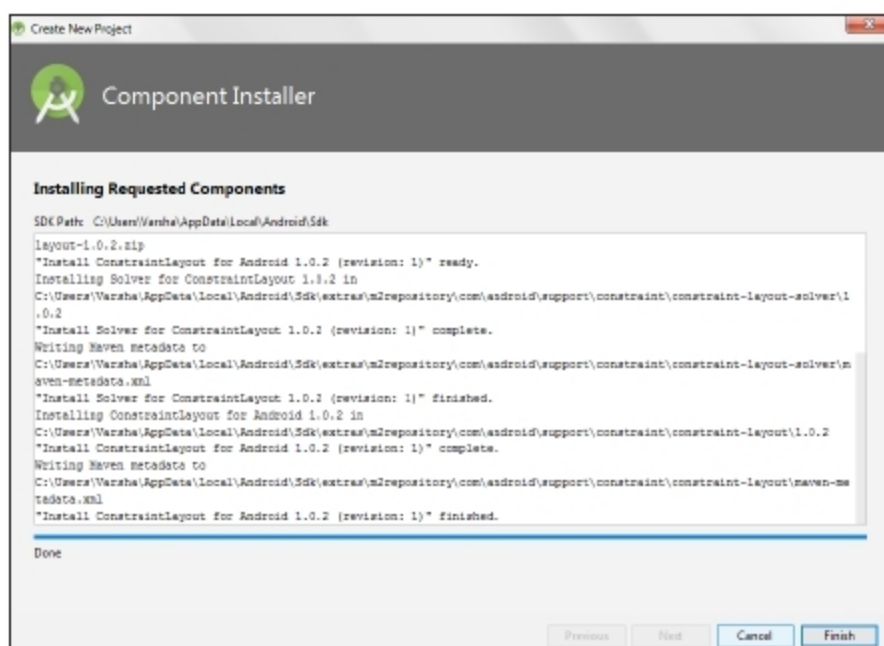

Figure 9: Component installer

8. After that, click **Next** to start the installation.
9. Once the project has been created, to test the application, we need a virtual device. So before writing the code, launch **AVD Manager** in Android Studio. Once your **AVD Manager** has been created successfully, it means your system is prepared for Android development.

10. Now write the code and test it in an emulator device.

Stable release	3.2
Licence	Freeware + SourceCode
Website	developer.android.com/studio/index.html
Written in	Java and Kotlin
Operating systems	Windows, MacOS, Linux
Main features	Gradle – for build support Lint tool – to check performance, usability and version compatibility ProGuard – for integration and app-compatibilities Support build in – Google Cloud Platform, enabling integration with Firebase cloud messaging and Google App Engine For device testing – Android Virtual Device (emulator)

IntelliJ IDEA

IntelliJ IDEA is specially used for developing Java based applications. Developed and maintained by JetBrains, it is available in the community and 'Ultimate' editions. It has innumerable features for rapid app development and to improve code quality/analysis, including the in-built version control tool, compiler, debugger, various frameworks, support for code compilation, code navigation, code refactoring, the terminal, database tools, application server which boots the development process, etc.

IntelliJ IDEA also supports the development of native and hybrid applications.

Windows installation:

1. Go to the official website www.jetbrains.com/idea/ and download IntelliJ IDEA in a Windows machine.
2. Perform the following steps depending on your OS (Windows, in this case):
 - i. Run the *ideacIC.exe* or the *ideaIU.exe* file, which is downloaded.
 - ii. Follow the instructions in the installation wizard.
 - iii. If it is using the first instance, then do not use the *Import settings* option.
 - iv. Disable the unnecessary plugins.
 - v. Download and install particular plugins from the IntelliJ IDEA plugin repository as required by the project.
3. After completing the proper setup, create your project in IntelliJ IDEA.
