Figure 5: Starting the MongoDB server from the BIN directory

Figure 6: Output from the GridFS database using *find()*

Figure 7: Inserting a line of PHP-MongoDB driver in *php.ini*

The keyword 'gridfs' represents the name of the database that is to be used for the storage and retrieval of files. In case the database is not already created, MongoDB will create a new database with the same name dynamically. *MyVideo.avi* is the video file to be uploaded using GridFS.

To search and view the document in the database, execute the following command on a MongoDB prompt:

```
MongoDB Prompt> db.fs.files.find()
```

To display all the chunks created, the following instruction is executed:

```
MongoDB Prompt> db.fs.chunks.find({files_id:ObjectId('
```

```
58bc0b91bf9bde1294 0a1640')})
```

Interfacing MongoDB-GridFS with PHP

The integration of PHP with MongoDB can be done using the MongoDB driver available at *https://s3.amazonaws.com/drivers.mongodb.org/php/index.html*.

After downloading *php_mongo.dll*, the following line is inserted in the *php.ini* file:

```
extension = php_mongo.dll
```

Once the PHP-MongoDB driver is ready, GridFS can be used.

Use the following script to upload and store a large file using PHP-MongoDB-GridFS:

```
<?php
    $BigDataConnection = new Mongo("127.0.0.1:27017");
    $db = $BigDataConnection->BigDatabase;
    $db->authenticate("database-username","database-
password");
    $biggrid = $db->getGridFS();
    $name = $_FILES['BigFile']['name'];
    $type = $_FILES['BigFile']['type'];
    $id = $biggrid->storeUpload('BigFile',$name);
    $files = $db->fs->files;
    $files->update(array("filename" => $name), array('$set' =>
array("contentType" => $type,
    "aliases" => null, "metadata" => null)));
    $BigDataConnection->close();
    exit(0);
?>
```

To display all files using PHP-MongoDB-GridFS, use the following script:

```
<?php
    $BigDataConnection = new Mongo("127.0.0.1:27017");
    $db = $BigDataConnection->BigDatabase;
    $db->authenticate("database-username","database-
password");
    $biggrid = $db->getGridFS();
    $mycursor = $biggrid->find();
    foreach ($mycursor as $myobj)
        {
        echo 'Filename: '.$myobj->getFilename().' Size:
'.$myobj->getSize().'<br/>';
        }
    $BigDataConnection->close();
    exit(0);
?>
```
