Internet of Things applications: Cassandra is the right choice for applications where data is travelling at very high speeds between different devices or sensors.

In activity-tracking and monitoring applications: Numerous entertainment and media organisations use Cassandra to monitor user activity based on parameters such as movies, music, album, artist, etc.

In heavy write systems or in time-series based applications: Cassandra is perfect for the very heavy write system—for example, in Web analytics where data is logged for each and every request based on hits, by type of browser, traffic sources, location, behaviour, technology, devices, etc.

Social media analytics and recommendation engines: Cassandra is used by many social media providers to analyse data and provide suggestions to their customers.

Product catalogues and retail applications: One very popular use case of Cassandra is to quickly display product catalogue inputs and lookups in retail applications.

Messaging: Cassandra serves as the database backbone for numerous mobile phone and messaging providers' applications.

Apache Cassandra is one of the most popular open source distributed database systems available. It provides

a more flexible data model than what's offered in the relational database world. You can scale it up to any number of concurrent user connections and/or data volume. It can easily distribute data among multiple geographies, data centres and the cloud. So if your application has a large amount of data, and if you are planning to scale it, then Cassandra will definitely help you.
