to analyse profit-loss margins, revenues, and trends like maximum orders, average order values, etc. There are many platforms like Magento, Prestashop, etc. with which Piwik can easily be integrated.

#### ■ Server log analytics

Web servers generate lots of logs. We can use Piwik to collect and analyse those logs and generate meaningful insights. We can analyse access logs, failure and exceptions in logs, forecast the health of the hardware, avoid transaction failures and do much more.

#### ■ Intranet analytics

Many government organisations, universities and enterprises have their own intranet network due to privacy issues. Their major requirement is to use analytical tools within their premises and Piwik provides this option.

There are lots of gadgets and plugins available in the Piwik marketplace, which we can use based on customer use cases.

## A demo of Piwik

We will see how we can install Piwik in a WAMP server on localhost. The installation is very easy.

The WAMP server is used in Windows. Similarly, for Linux, we can use the LAMP server. Installation steps are mostly the same for any distribution. Here, we will consider Windows for the demo.

The steps given below demonstrate the configurations for Piwik. First, go to <https://piwik.org/download/> and download the Piwik file as shown in Figure 1.

Now, go to the `/www` relative path. In my case, as I am using a local machine, it's `C:\wamp\www`. If you are hosting

your website, then search accordingly. Go to the `www` folder where all the projects are listed. Copy the archive file and extract it here. See Figure 2.

Next, go to the browser, and open the `/piwik` related path. In my case, it's `http://localhost/piwik/`. If you are on a production server, then `localhost` is replaced by your domain name, as shown in Figure 3

Now click on **Next**. There are totally eight steps to complete the entire setup of Piwik. We will examine all the steps.

Step 1 is *Welcome*, which is done. Step 2 is the system check, when Piwik checks for system compatibility and throws errors or warnings if anything is critical. Figure 4 provides the snapshot for this—we can see some errors. From the description, we can resolve the errors.
