Setup a Website

Super User created successfully!

Please setup the first website you would like to track and analyse with Piwik:

Website name:

Website URL:

Website title:

Website time zone:

Select a city:

Is this an E-commerce site: ☐

Next

After once the Piwik install is finished, you will be able to add more websites to track!

Figure 7: Setting up of a website completed

Here, in my case, `always_populate_raw_post_data=-1` is not there in the `php.ini` file. Add this line in the `php.ini` file, restart the server and reload the page. Once the error is resolved, click the **Next** button.

Now you can see the database set-up screen. Before that, create a separate database for Piwik. Go to the `phpmyadmin` panel and create a new database. Complete the database set-up stage with your MySQL user name and password, and enter the database name which we have just created for Piwik. See Figure 5.

Once the database set-up is complete, click **Next** and go to the stage of creating the table.

Now we will create a super user and provide credentials for it (Figure 6).

Next, provide the details of the website that has to be analysed (Figure 7).

The next thing is the tracking code. Figure 8 shows the JavaScript code which we can use in websites, in WordPress, or in any blog or CMS platform to track and start analysing the website.

The Piwik set-up is now complete. Go with the default settings. Log in to Piwik with super user credentials.

Once you log in to Piwik, you can see that we haven't started analysing the website. Go to the sample `code.html` and paste the code.

Once you reload the page, you can see the visitors and actions performed by them. See Figure 10

There are specific tabs for visitors, actions, referrers, e-commerce and goals. These are self-explanatory, so we will not go deep into the topic. This information will however help you to kickstart your own analytics platform.

Website Analytics created successfully!

Tracking code for Analytics

To track your web traffic with Piwik, you need to make sure some code is added to each of your webpages. To most websites, `http://code.jquery.com/jquery-latest.js` and `http://www.piwik.org/javascript/index.php` are the only two plugins you need to integrate Piwik. If you plug into a CMS, you can copy the code from the templates and add it to the footer file.

JavaScript Tracking Code

Make sure this code is on every page of your website before the <body> tag.

```
<!-- Piwik -->
<script>
  (function () {
    var _paq = _paq || [];
    _paq.push(['setSiteId', '1']);
    _paq.push(['trackPageView']);
    _paq.push(['enableLinkTracking']);
    (function () {
      var d = document, g = d.createElement('script');
      g.src = 'http://www.piwik.org/javascript/index.php';
      d.getElementsByTagName('head')[0].appendChild(g);
    })();
  })();
</script>
```

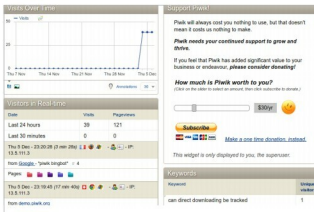

Figure 10: Piwik dashboard updates

There are many competitors providing analytics platforms but Piwik is one of the simplest, user friendly, free and open source tools available for the job.

Given below are the links to blogs, forums and additional plugins that are readily available for use with Piwik. [END](https://www.linkedin.com/in/maulikparekh2)
