

- A corresponding entry will be created in a trading account.
To get the current valuation of your assets:
- Under *Tools*, select *Price Editor*.
- You can click on 'Get Quotes' to get online quotes.
- Add the current price of each security for which an online quote is not available.
- The Stock and Mutual Fund accounts will now reflect the values as per their current prices.

Online quotes

Online quotes do not work for Indian securities. GNUCash uses a Perl module, *Finance-Quote*, to get the online quotes.

Yahoo Quotes used to work for BSE and NSE exchanges. However, Yahoo no longer provides the quotes for Indian stocks in the required format. Some people have been working on finding alternate solutions, which are not available yet in the Perl module.

As far as mutual funds are concerned, you may enable 'Get Online Quote' using *Securities Editor* and use the multiple quotes option – India Mutual (AMFI). There seems to have been a recent change in the URL for getting the quotes. I had to manually change the URL in the Perl script, *IndiaMutual.pm*, to <http://www.amfindia.com/spages/NAVOpen.txt>.

GNUKhata

GNUKhata is a flexible accounting and inventory management system meant for a wide range of organisations. In this article, you will discover that it can be used to manage your personal financial information as well.

You can download the system from gnukhata.in. It is packaged in a Docker image and is available for a number of Linux distributions. The advantage of the Docker image is that there is no need to worry about the dependencies.

The application interface is Web based and the back-end stores the data in a PostgreSQL database. By default, it uses the HTTP port of the localhost. Hence, you should not be running a Web server on your system. You may, of course, change the default settings while installing.

If you use the *Investment accounts* file, you will only be able to keep track of the amount of money you invested and not its current value. It is better to treat every security you own as an inventory item, since you buy and sell your securities to your broker.

The first step is to create your organisation's database and create the securities. You can use dummy data for the required fields, as follows:

- Click on *Create Organisation*.
- Enter the required fields and select *Inventory*.
- Create an admin user.

- Now create *Products* under the *Inventory* menu option – one product for each security you own.
- You may create and use the units as 'Shares' for stocks and 'Units' for mutual funds.
- You may enter the current number of stocks/mutual funds as the opening balance.
- Tax information may be ignored.
When you buy or sell a security, you must change the inventory of the security. In addition, you will be making or receiving a payment.

A simple option is to create a *Purchase Invoice* when buying a security and a *Sales Invoice* when selling one. Follow the steps given below:

- Under the *Master* menu options, select the *Customer/Supplier* option.
- Create one broker as a *Customer* and one broker as a *Supplier* (GNUKhata does not allow one entry to function as both).
- The system will create corresponding accounts under *Current Assets* and *Current Liabilities*.
- Whenever you buy or sell a security, create a *Purchase Invoice* or a *Sales Invoice*.

The securities stock will get updated. Now, the final step is to update the account information. You have to create an account for your bank, which is used to receive and make payments. GNUKhata restricts the accounts available for a transaction based on the voucher type. So, for the sake of simplicity, you may create two accounts – *Security Sales* (in *Direct Income*) and *Security Purchases* (in *Direct Expenses*).

- From the *Voucher* menu options, select the *Purchase* or *Sale* option.
- For the *Sale* vouchers, select the *Sales invoice*.
- In the first (Dr) row, select the bank in which the money is received.
- In the second (Cr) row, select *Security Sales*.
- For the *Purchase* vouchers, select the *Purchase invoice*.
- In the first (Dr) row, select the *Security Purchases* account.
- In the second (Cr) row, select the bank account from which the payment is made.

What remains though is the valuation of the inventory. Since GNUKhata is actively maintained, as many people use it, more capabilities will keep getting added to it.

In an upcoming article, we will explore the programming aspects of GNUKhata.
