

administer a cluster of nodes.

### Features

- High availability and load balancing.
- Live migration and Web based administration.
- State-of-art security via SELinux, and access controls for virtual machines and the hypervisor.
- Powerful integration with varied open source projects like OpenStack Glance, Neutron and Katello for provisioning and overall administration.
- Highly scalable and self-hosted engine.

**Official website:** <https://www.ovirt.org/>

**Latest version:** 4.1.2

## Weaveworks

Weaveworks comprises a set of tools for clustering, viewing and deploying microservices and cloud-native applications across intranets and the Internet.

### Tools

- *Weave Scope*: Provides a visual monitoring GUI interface for software development across containers.
- *Weave Cortex*: Prometheus-as-a-Service open source plugin for data monitoring in Kubernetes based clusters.
- *Weave Flux*: Facilitates the deployment of containerised applications to Kubernetes clusters.
- *Weave Cloud*: Combines various open source projects to be delivered as Software-as-a-Service.

### Features

- Powerful GUI interface for viewing processes, containers and hosts in order to perform all sorts of operations and microservices.
- Real-time monitoring of containers via a single-node click.
- Easy integration via no coding requirements.

**Official website:** <https://www.weave.works/>

## Wercker

Wercker is an open source autonomous platform to create and deploy containers for multi-tiered, cloud native applications. It can build containers automatically, and deploy them to public and private Docker registries. Wercker provides a CLI based interface for developers to create Docker containers that deploy and build processes, and implement them on varied cloud platforms ranging from Heroku to AWS and Rackspace.

It is highly integrated with Docker containers and includes application code for easy mobility between servers. It works on the concept of pipelines, which are called 'automated workflows'. The API provides programmatic access to information on applications, builds and deployments.

### Features

- Tight integration with GitHub and Bitbucket.
- Automates builds, tests and deployments via pipelines and workflows.
- Executes tests in parallel, and saves wait times.
- Works with private containers and container registries.

**Official website:** <http://www.wercker.com>
