

implementing in this session.

The theme of the application

I hope the initial introduction has made things clear for you. We are making a digital restaurant booking application with the help of which you will be able to secure your table at the said restaurant. This will prevent you from waiting in queues on busy weekends. You are already aware of all the components that I will be using for this application, like buttons, labels, horizontal arrangement, textbox, Firebase DB, etc.

GUI requirements

For every application, there is a graphical user interface or GUI, which helps the user to interact with the on-screen components. How each component responds to user actions is defined in the block editor section. In this application, we will have multiple screens and will define the look and feel for each of them.

Total GUI screens: Four

Screen names:

1. Screen1
2. Login screen
3. New user screen
4. Booking screen

Figure 5: Rules with read and write permissions

Table 3

Component name	Purpose	Location
1 Label	To display a label	Palette-->User Interface-->Label
2 Button	To trigger events	Palette-->User Interface-->Button
3 Horizontal arrangement	To arrange the child components	Palette-->Layout-->Horizontal Arrangement
4 Notifier	To display on screen information	Palette-->User Interface-->Notifier
5 Text box	To take user input	Palette-->User Interface-->TextBox
6 TinyDB	To store data	Palette-->Storage--> TinyDB

Table 4

Component name	Purpose	Location
1 Label	To display a label	Palette-->User Interface-->Label
2 Button	To trigger events	Palette-->User Interface-->Button
3 Horizontal arrangement	To arrange the child components	Palette-->Layout-->Horizontal Arrangement
4 Notifier	To display on screen information	Palette-->User Interface-->Notifier
5 Firebase DB	For storing the data	Palette-->Experimental-->Firebase DB

GUI requirements for the application

1. **Label:** Labels are static text components, which are used to display some headings or markings on the screen.
2. **Button:** Buttons will let you trigger the event and are essential components.
3. **Horizontal arrangement:** These are special components, which keep all child components within them horizontally aligned.
4. **Notifier:** This is used to display some instructions or give controls over your existing components. We will explore its functionality in more detail as we implement it in our game.
5. **TinyDB:** This is the internal storage within your device, which will be used to keep confidential data such as passwords.
6. **Text box:** Text boxes are pretty simple objects and are used to take inputs from the user. You can control the type of text box you want by setting various properties, such as only numeric or multiple lines.

Table 1 lists the components that we will need for

Screen1, which we will drag to the designer from the left hand side palette.

1. Drag and drop the components mentioned in the table to the viewer.
2. Visible components can be seen by you while the non-visible components will be located beneath the viewer under the tag 'Non-visible'.
3. We have placed a label so as to put the name of the application.
4. All buttons need to be put in the horizontal arrangement to keep them aligned horizontally.
5. If you have dragged and placed everything, the Screen1 layout will look something like what's shown in Figure 6.
6. Make the necessary property changes for the label and button components so that they fit well on to the screen.
7. Renaming the components helps to identify them in the block editor.
