

Figure 6: Designer screen (Screen1)

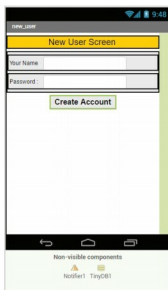

Figure 7: Designer screen (new user screen)

Figure 8: Designer screen (sign-in screen)

Figure 9: Designer screen (booking screen)

In a similar fashion, we will design the remaining three screens as well. Table 2 gives the components that we will require for the new user screen, which we will drag on to the designer from the left hand side palette.

If you have dragged and placed everything, the new user screen layout will look something like what's shown in Figure 7.

Table 3 gives the components that we will require for the sign-in screen, which we will drag on to the designer from the left hand side palette.

If you have dragged and placed everything, the sign-in screen layout will look something like what's shown in Figure 8.

Table 4 gives the components that we will require for the booking screen, which we will drag on to the designer from the left hand side palette.

If you have dragged and placed everything, the booking screen layout will look something like what's shown in Figure 9.

Configuring Firebase

To use Firebase DB in the application, you need to give the URL of the project database and set the properties of the project bucket. The project bucket is equivalent to the folder in your Windows directory system. This means that within a single Firebase project, you can store data of multiple applications under different bucket names.

Figure 10: URL of the project

Now let's head towards the block editor to define the types of behaviour, and let's discuss the actual functionality that we expect from our application.

1. On the very first screen, upon clicking the sign-in or new user button, users should be able to navigate to the respective screens.
2. Implementing logic for new users and for signing in.
3. On the booking screen, confirming the details from the user and saving them on the Firebase database.

So let's move on and add these types of behaviour using the block editor. There is a button available right above the *properties* pane to switch between the designer and block editor.

Block Editor blocks

I have already prepared the blocks for you. All you need to do

Figure 11: Set the URL to the Firebase component

is drag the relevant blocks from the left-side palette and drop them on to the viewer. Arrange the blocks in the same way as shown in Figure 12. I will explain each one — what it does and how it is called. As the logic for the three screens other than the booking screen is pretty simple, I am giving the logic only for the booking screen and am making it brief.
