

Figure 12: Block Editor Image 1

Now you are done with the block editor too. Next, we will download and install the app on your phone to check how it is working. But make sure you complete the blocks for the rest of the applications. I am sure that you will be comfortable making the blocks for the remaining screens. If you face any difficulty, write back to me and I will be delighted to help you out.

Packaging and testing

To test the app, you need to get it on your phone. First, you have to *download* the application to your computer and then move it to your phone via Bluetooth or USB cable. I'll tell you how to download it.

1. On the top row, click on the 'Build' button. It will show you the option to download the apk to your computer.
2. Downloading will show progress and once successfully done, the application will be placed in the *Download* folder of your directory or the preferred location you have set for your downloads.
3. Now you need to get this apk file to your mobile phone either via Bluetooth or via USB cable. Once you have placed the apk file in your SD card, you need to install it. Follow the on-screen instructions to do so. You might get some notifications or warning saying, 'Install from untrusted source'. Allow this from the settings and after successful installation, you will see the icon of your application in the menu of your mobile. Here you will see

the default icon, which can be changed, and we will tell you more about this as we move ahead in this course.

I hope your application is working exactly as per the requirements you have set. Now, depending upon the features you want for the app, you can change various things like the image, sound and behaviour.

Debugging the application

We have just created the prototype of the application with very basic functionality, so let's consider what else the user might be interested in. Carefully think about scenarios that may annoy the user and look at how your app could overcome such pitfalls. Consider the cases below:

1. What if the system is already seeing a queue; can we put an alert message saying that your booking has not been confirmed?
2. Can we add phone contacts and other options to reach out to the restaurant staff from the application?
3. Can we generate a barcode or print a receipt of the booking confirmation?

These are some of the scenarios that might occur and the user will be pretty happy seeing them addressed.

Think over all these scenarios and consider how you can integrate these into the application. Do ask me if you fail to address any of the above cases.

You have successfully built another useful Android app for yourself. Happy inventing!
