

DVD OF THE MONTH

Experience Linux in live mode.

KNOPPIX 7.7.1

KNOPPIX is an operating system based on Debian and is designed to run directly from a live DVD. It is one of the oldest Linux distros that runs live. The first edition of the live CD was released way back in September 2000.

This is a bootable DVD with a collection of GNU/Linux software. It can be used as a productive Linux system for the desktop, an educational OS, rescue system, or adapted and used as a platform for commercial software product demos. The latest release comes with a choice of LXDE, KDE Plasma 5.7 and GNOME Shell 3.22 desktops.

The minimum hardware requirements for running this DVD are an Intel/AMD-compatible processor (i486 or later) with 512MB RAM and a bootable CD-ROM drive.

What is a live DVD?

A live CD/DVD or live disk contains a bootable operating system, the core program of any computer, which is designed to run all your programs and manage all your hardware and software.

Live CDs/DVDs have the ability to run a complete, modern OS on a computer, even without secondary storage, such as a hard disk drive. The CD/DVD directly runs the OS and other applications from the DVD drive itself. Thus, a live disk allows you to try the OS before you install it, without erasing or installing anything on your current system. Such disks are used to demonstrate features or try out a release. They are also used for testing hardware functionality, before actual installation.

To run a live DVD, you need to boot your computer using the disk in the ROM drive. To know how to set a boot device in BIOS, please refer to the hardware documentation for your computer/laptop.
