If you are a first time Jove user, you might feel that some functions are missing. It could either be because of Jove's limitations or because you are not using Lisp anymore. However, this minimalistic utility tool is sufficient to make editing text much easier on Linux.

Jove offers customisations through some simple lines of code. Besides, it has the option to search all possible commands in an easy way. These features make the tool a good replacement for Vim.

Initially, the Jove package was available on Debian and Fedora. But you can rebuild its package to match your distribution. The package executive is 150K in size.

Shooter game Postal becomes open source after two decades of release

Ahead of reaching its 20th anniversary, Arizona based Running With Scissors has

released the code of popular video game Postal. The isometric shooter game was released back in September 1997. "It was an instant hit, grabbing the attention of gamers, parents and politicians across the country, and we have been supporting and updating it ever since. But now, (almost) 20 years later, we are entrusting our

fans with the future of our game, by releasing its source code to the public," the developer team at Running With Scissors wrote in a blog post.

However, this is not the first time that Postal has reached out to the open source community. Running With Scissors announced the release of its code in 2015 on the condition that it will port it to the Sega-made Dreamcast console. Later, its source code even reached a community developer who brought it to Linux for the OpenPandora handheld.

Developers can learn a lot from the open source release of Postal. Game developers can reuse the code in their own projects and build something iconic for the gaming world.

The source code of Postal is available on Bitbucket under the GPLv2 license. It comes with the complete documentation to help you utilise the release effectively.

Facebook open sources its Atom tool

Facebook has released the code of its native Atom-based tool called Atom in Orbit.

The latest development is aimed at providing developers a remote development environment that can run right in a browser.

Based on the Nuclide IDE, Atom in Orbit offers a standard user base and some extensions to help developers examine their code without any integrated development environment (IDE) on their desktop. The tool has the

same keyboard shortcuts that were previously supported by Atom. This is a good experience for developers who are quite familiar with the open source desktop editor.
