

approach has also been followed in the case of Redfish DMTF specifications and related open source. The engineering team has also brought in some OEM extensions of the standards, to add features that are not available in traditional standards.

### Dell India contributes over 40 per cent

While the iDRAC with LC and CMC products that are part of the OOB management solution was the brainchild of global Dell engineers, the team based in India accounts for more than 40 per cent of the worldwide development of this solution. This highlights the Dell India team's product engineering skills related to IP creation, as well as its capabilities in contributing to the open source community.

### Contributing back to the community

While consuming open source software, Dell's OOB solution teams in India and in the US contribute to nearly 50 open source packages by interacting with several maintainers directly. There are product development teams that identify the potential of available open source packages and pick the most efficient ones to enhance server manageability. Further, Dell has created an internal server software open source software review (SSOR) team that includes volunteers from different

project units to oversee existing open source integration activities. The same team is also responsible for evaluating requests for new open source package integration.

The group of engineers under the SSOR team prototype and evaluate open source package usage in the product. Also, they archive the requests for evaluation and all the related material for future references. It is mandatory to stream the open source code used in the existing products for community consumption within 30 days of the product GA (general availability) release. "We contribute to open source through various proposals as well as release the code of some of our in-house developed modules catering to open standards frameworks. We also raise issues and propose various solutions by participating in many open source communities working on systems and server management standards, Linux, Web servers and embedded tools used for manageability," Rama states.

So, in this way, Dell not just consumes open source but also contributes back to the community with its innovative solutions. **END**
