

For more information, go to its official site:
<http://www.openvas.org/>

5. Metasploit Framework

This is free and open source penetration software, which is very popular among white or black hat hackers. It's the best tool to test the network in an offensive way against open and well-known vulnerabilities. It's a combination of different modules for checking different exploits. It is also used for auditing and scanning.

For more information and to download this software, go to the following link: <https://www.metasploit.com/>

6. Kali Linux

This is an offensive Debian based Linux security distribution with lots of free software, utilities and security testing tools. It's widely used for penetration testing. If you want to be a hacker, you should learn Kali OS.

Here is the official website for Kali Linux:
<https://www.kali.org/>

7. Nikto

This free and open source Web server scanner comes with comprehensive test scenarios covering thousands of vulnerabilities. Though it cannot detect all kinds of exploits (SQL based exploits), this tool is still very handy to check for popular vulnerabilities missed in the Web server. It also checks for outdated versions and misconfigurations related to server settings. It has been in the market for almost 10 years.

You can refer to the website for more information about Nikto and to download this utility.

<https://cirt.net/Nikto2>

8. Wireshark

Wireshark is a free and open source, highly popular network protocol analysis tool. It is used by students, network administrators and hackers. It enables us to view the traffic, dump some packets, check the packet format and find where the problem lies. It is widely used by fresh network enthusiasts

to learn networking concepts. It's available in all OS flavours.

The official site to download Wireshark is:
<https://www.wireshark.org/>

9. VeraCrypt

VeraCrypt is the free encryption utility available to encrypt the file system.

Nowadays, we store our data in Dropbox, Google Drive and other cloud based software which guarantee privacy and security. But what if employees of those cloud services companies use that data for their own purposes? A better option is to encrypt those files/flash drives before dumping them into the cloud.

Here is the link to download this software:
<https://veracrypt.codeplex.com/>

10. KeePass

KeePass is free and open source software to manage all your passwords in one place, securely. Sometimes we use the same passwords for different accounts on different websites, which could lead to a serious problem. If someone cracks that password and has your user ID, then they will have access to your different accounts. Sometimes we also store passwords in browsers, which is also not a safe habit, as anyone getting access to your computer can see them. KeePass provides the best solution. Different passwords can be managed in one place with just one master password with an encrypted layer. All the passwords are unlocked by this master key and, at the backend, all the passwords are stored in a highly encrypted format by using the most popular and uncrackable algorithms. You can give it a try if you are tired of trying to remember passwords and want to store them securely.

Here is the website to download this utility:
