

The framework is based on Ubuntu 9.04, is fully open source and receives regular updates with regard to products.

Key features:

- Contains many tools for reconnaissance, mapping, discovery and exploitation, especially focusing on Web penetration testing.
- Equipped with SVN to provide updated security tools, and syncs with active development tools.

Latest version: 3.3.2

6. Network Security Toolkit

The Network Security Toolkit (NST), based on Fedora, is a live bootable DVD/USB Flash drive consisting of the top 125 open source security tools provided by *insecure.org* to perform network security, penetration testing, network diagnostics and monitoring of day-to-day tasks. The main objective behind the development of NST is to provide network/systems administrators a combined set of open source security tools to carry out operations like network traffic analysis, intrusion detection, network scanning and security patching.

NST has been developed by Ronald W. Henderson and Paul Blankenbaker. It provides a Web interface known as NST WUI and all the tools can be accessed via the Web page. NST is equipped with intelligent package management capabilities based

on Fedora and maintains its own repositories of additional packages.

Key features:

- Provides visualisation of ntopng, ntop, Wireshark, traceroute, NetFlow and Kismet data.
- JavaScript console with built-in object library helps in the development of dynamic Web pages.
- Other features include network intrusion detection, Web-based Snort IDS integration, active connections monitor, VNC/RDP desktop session management, host/IPV4 address geolocation and network segment ARP scanner.

Latest version: 24-7977 Release.

7. BlackArch Linux

BlackArch is an Arch Linux based security and penetration testing distribution, which consists of more than 1600 tools and is regarded as the first choice distribution among security researchers to do Web and applications based security testing. It is a strong alternative to Kali Linux and Backbox in terms of the variety of its tools and ease of use.

BlackArch is basically a lightweight extension to Arch Linux for security researchers, as the tool set within the former is distributed as the Arch Linux unofficial user repository and can even be installed on top of existing Arch Linux.

Arch Linux can be installed on

32-bit and 64-bit machines including ARM based development boards like Raspberry Pi, BeagleBone, etc.

Key features:

- GUI interface is powered by Fluxbox and includes i3, WMii, Spectrwm, Awesome, dwm and Openbox window managers.
- Has modular package groups.
- Installation can be performed from source.

Latest version: 2016.12.29

8. Cyborg Hawk Linux

Cyborg Hawk Linux is regarded as the most advanced, powerful and well-managed Ubuntu based penetration testing Linux distribution created by Zirela Knowledge Solutions Pvt Ltd. The distribution consists of more than 700 tools dedicated to penetration testing, and more than 300 tools for mobile security and malware analysis.

Cyborg Hawk Linux is completely open source and free to use, and the latest version comes with its own repository. The distribution is highly reliable and stable in the eyes of ethical hackers and pen testers for real-world stress testing of networks, malware analysis and finding out back doors.

Key features:

- Full support for wireless devices.
- Can be installed as a virtual machine.
- Managed and well-sorted menus in
