

Figure 5: Shorewall

Figure 6: Endian Firewall

Figure 7: VyOS

Some of the features provided by the Endian Firewall are displayed in Figure 6.

- Endian is a bi-directional firewall
- It protects the network from Internet threats
- By analysing the traffic flow, it prevents intrusion into the network
- It has VPN with IPsec, which provides a secure and simple VPN tunnel through which many users can connect from a remote location

IPCop

IPCop is an open source Linux firewall which is secure, user friendly, stable and easily configurable. It provides an easily understandable Web interface to manage the firewall. It is most suitable for small businesses and local PCs.

Features

- It is a stable, secure and easily configurable firewall based on Linux
 - Administrative tasks can be performed easily through the built-in Web server
 - It can obtain its IP address from the ISP using a DHCP client
 - It can configure your machine using a DHCP server
 - It provides a DNS proxy which helps in speeding up domain name queries
 - It provides a Web caching proxy which speeds up Web access
 - To prevent intrusion into the network, IPCop has a well-defined intrusion detection system
- It divides the network into different zones:
- Green – Internal trusted network and protected from the Internet
 - Blue – Wireless semi-trusted network
 - Orange – Publicly accessible servers
 - Red – Internet connected via USB, modem, etc.
- It provides support for multiple languages
 - It provides traffic shaping capabilities, which give highest priority to interactive services over lower priority tasks

such as FTP

- It provides VOPN support with x509 certification
- We can choose the kernel configuration that is optimum for us

VyOS

VyOS is open source and completely free, and based on Debian GNU/Linux. It can run on both physical and virtual platforms. It provides a firewall, VPN functionality and software based network routing. It also supports paravirtual drivers and integration packages for virtual platforms. Unlike OpenWRT or pfSense, VyOS provides support for advanced routing features such as dynamic routing protocols and command line interfaces.

Its features are described in Figure 7.

UFW or Uncomplicated Firewall

UFW is iptables with less complexity and, hence, is more user friendly. It is the default firewall for Ubuntu servers. Creating an IPV4 or IPV6 host based firewall is also possible by using UFW, which provides a user friendly framework that helps us

to manage command line interfaces and NetFilter. UFW also has a GUI interface along with the command line. The GUI tool of UFW is called GUFW, which makes working with the system simple.

The features of UFW are shown in Figure 8.
