Figure 8: Sass

7. MongoDB

MongoDB is a free and open source database written in C++. It is a document-oriented database that stores documents in a collection. It is one of the leading NoSQL databases and uses JSON-like documents. It is an open format, schema less database, ideal for object-oriented programming. MongoDB was designed by a company called 10gen in 2007.

8. Syntactically Awesome Style Sheets (Sass)

Sass is a CSS pre-processor that helps in writing reusable, extensible and maintainable code. Sass contains features that include variables, mixins, and nesting of selectors, functions and expressions. Using Sass, we can make large and complex style sheets easier to understand and maintain. It is an open source style sheet language designed by Hampton Catlin.

9. GitLab

GitLab is an open source, Web based Git repository manager. It provides features like code reviews, access controls, issue tracking, activity feeds and wikis. GitLab has continuous integration and deployment built in, to help you test, build and deploy code. GitLab was originally developed by GitLab Inc. It was written by Dmitry Zaporozhets and Valery Sizov.
