

```
|Debian
|Fedora
|RedHat
|Open Suse
|Linux Mint
|Apricity
|===
```

In the above code, '<' means left alignment, '^' means centre alignment, and '>' means right alignment.

Column width: Setting the column width is useful—your content doesn't overlap in the table because of lack of space. The width values range from 1-99.

```
[cols="10,20,30"]
|===
|Debian
|Fedora
|RedHat
|Open Suse
|===
```

Cell duplication: Sometimes, in tables, the same data needs to be replicated in consecutive columns—for example, default values. To duplicate a cell for successive columns, you can use the number along with the '*' as a prefix to '|'.

```
|===
|London |Sydney |Hamburg
3*|Stockholm
|Nairobi |Prague |Budapest
|===
```

Debian	Fedora	RedHat
Open Suse	Linux Mint	Apricity

Figure 3: Column alignment

London	Sydney	Hamburg
Stockholm	Stockholm	Stockholm
Nairobi	Prague	Budapest

Figure 4: Cell duplication

- Alexander Dumas
- Baroness Orcy
- Sir Arthur Conan Doyle
- George Orwell

Figure 5: An unordered list

Importing from external sources: AsciiDoctor can import CSV and DSV datasets to your tables using the *include* directive, as follows:

```
[format="csv", options="header"]
|===
include::movie.csv[]
|===
```

The first line of the code states the format of the dataset that will be used in this table and adds the header for the table.

Lists

AsciiDoctor supports both ordered and unordered lists. The syntax for declaring them looks similar, except for one tiny character. For unordered lists, you need to use '*', as shown below:

```
* Alexander Dumas
* Baroness Orcy
* Sir Arthur Conan Doyle
* George Orwell
```

If you wish to have square bullets for your lists, modify the code as shown below:

```
[square]
* Alexander Dumas
* Baroness Orcy
* Sir Arthur Conan Doyle
* George Orwell
```

For ordered lists, you can use '.' in front of the items you wish to place in a list, as follows:

```
.My Favorite Authors
. Frederick Forsyth
. Dan Brown
. Steve Berry
. Scott Mariani
```

It is important to notice that, in the first line, there's no space between the period and the title of the list. Also, there's a space given between the period and the list items.

If you wish to reverse the list, just add [%reversed] at the top of the list declaration, as shown below:

```
[%reversed]
.My Favourite Authors
. Frederick Forsyth
. Dan Brown
. Steve Berry
. Scott Mariani
```
