

Images, video and audio

Image: An image is worth a thousand words. People find documents that contain only text unattractive and boring. Inserting images in your document could spice up the overall content.

```
.Duck Duck Go Search Engine Logo
image::duck-duck-go-logo.png[200,200]
```

The first line of the code adds a caption for the image, the second line inserts the image file *duck-duck-go-logo.png*, and the numbers in the brackets show the specified width and height of the image instead of its original size.

When you want to keep your images in a separate folder, you may use the *:imagesdir:* attribute. It will require an absolute path of that particular folder. You can save all the images in this folder to avoid them getting mixed up with other documents.

```
:imagesdir: /home/admin/Downloads/
image::Mozilla_Foundation_logo.svg.png[200,200]
```

The first line tells AsciiDoctor where to look for the images. In our case, it is *Downloads*. The next line inserts the image *Mozilla_Foundation_logo.svg.png* from the *Downloads* folder.

If you want to use an image from the Web, just add the file URL for the particular image, followed by brackets; it has the alternative text, width and height of the image.

```
image::https://upload.wikimedia.org/wikipedia/commons/d/db/
Elementary_logo.svg[ Elementary_OS,200,200]
```

Video and audio: Videos can be inserted in two ways. We can either use video from a video streaming site (YouTube or Vimeo) or you can add the video file from local storage:

```
.Creative Commons Video
video::sPuSg53RFb0[youtube]
```

The above line embeds a video from YouTube. The contents of the brackets show the name of the video streaming site. It is recommended that you use video files from the streaming sites since they provide an optimised version of the file, depending on the network, hardware and browser capabilities of your system.

Audio files can be included in the same way as video files, as shown below:

```
audio::yousetmefree.mp3[]
```

Other useful features

Apart from what's mentioned above, AsciiDoctor also offers some awesome features that can be used for fine tuning your content.

Admonition blocks: Writers use admonition blocks in their documentation in order to highlight the information. The most common admonition types are important, tip, warning, caution and note. In AsciiDoctor, we can use them as follows:

```
:icons: font
[TIP]
This is a local site without Online connections on the
Internet.
[CAUTION]
Cautionary Message
[WARNING]
Please read carefully, this is a Warning message
[NOTE]
This is the site for you!!!
[IMPORTANT]
This could be important
```

The first line of the code is optional, it instructs the asciidoctor to add icons instead of words to display the admonition blocks in your document.

Textual replacements: We can use textual replacement symbols such as copyright, registered and trade mark in the content, as shown below:

```
(C) - Copyright
(R) - Registered
(TM) - Trademark
```

Footnotes: Footnotes are special comments, references or additional information, which are usually placed at
