

Apart from the technical challenges, the cleanliness app is facing a significant issue in attracting people from the Indian region. "There has been no major success so far in terms of the audience. We have only received minor traffic and some sessions so far," Badami acknowledged.

Going forward, Badami and his team, which includes his friend and co-developer Rahul Lama, are set to release a mobile version of the My Clean India app. There are also some plans to release the application's features via an API.

Badami told *Open Source For You* that he is in talks with some organisations to expand the usage of his app. This would encourage more users to bring about cleanliness across the country.

Latest Linux kernel improves support for AMD Radeon graphics

The open source community has received Linux 4.9.2 as the latest kernel. This new Linux version has come with improved support for AMD Radeon graphics and includes various performance improvements.

Linux maintainer Greg Kroah-Hartman revealed in an email announcement that Linux 4.9.2 includes 141 file updates. To be precise, there are 1,031 insertions and 438 deletions.

The update has added better support for AMD Radeon HD 8000 series. Also, there are tweaks for Nouveau, Intel i915, InfiniBand, DVB, MMC, SCSI, thermal, staging and TTY drivers. The Linux kernel additionally comes with bug fixes for Atheros and Realtek hardware.

You can download Linux 4.9.2 by visiting kernel.org. Arch Linux and many other Linux distributions are likely to receive the newest update in the coming days.

The fresh Linux kernel emerges just after Kroah-Hartman announced the end-of-life-cycle for Linux 4.8 systems. The Linux team is seemingly promoting and encouraging its users to opt for the Linux 4.9 series, over its predecessors.

GitHub tool to search encrypted keys goes public

A tool that has been designed to find encrypted keys on GitHub is now available online. Called TruffleHog, this tool obtains results from Git repositories. "It searches through Git repositories for high-entropy strings, digging deep into commit history and branches," reads the description of TruffleHog on GitHub.

To bring out results, TruffleHog enters into the commit history of each branch, checks each *diff* from *commit* and evaluates the Shannon entropy. It assesses both the base64 char set and hexadecimal char set for every blob of text greater than 20 characters of each *diff*. If a high-entropy string is found to have less than 20 characters, the tool automatically prints the string to the screen.

Based on Python, TruffleHog uses the GitPython library to investigate *diffs* from commits. The same module is reportedly being used to search GitHub for private keys related to Amazon Web Services.

Microsoft enhances Bash on Windows to attract Linux fans

In 2016, Microsoft designed its Windows Subsystem for Linux (WSL) in the form of a Bash to deliver a partial open source experience. But just months after its original release, the proprietary tool has now received a major update to bring a complete Linux flavour right to your Windows 10 system.

Ford and Toyota among global auto giants promoting open source software

In what appears like a move against Apple and Google, Ford and Toyota have established a non-profit organisation.

The new development is aimed at promoting open source software and delivering smartphone connectivity on future vehicles.

Called the SmartDeviceLink Consortium, the organisation includes automakers Mazda Motor Corporation, PSA Group, Fuji Heavy Industries and Suzuki Motors in addition to Ford and Toyota. There are also suppliers like Elektorbit, Luxoft and Xevo. Further, Panasonic, Pioneer and QNX are also set to join the board. All these entities have apparently combined to rival Apple's CarPlay and Google's Android Auto.

"Connectivity between smartphones and the vehicle interface is one of the most important connected services. Using SmartDeviceLink, we can provide this service to our customers in a safe and secure manner," said Shigeki Tomoyama, president of Toyota's Connected Company, in a joint statement.

SmartDeviceLink offers developers an easy way to integrate their app's functions with in-vehicle technology like vehicle display screen, steering wheel controls and voice recognition. The Consortium expects that industry-wide adoption of the SmartDeviceLink platform will give developers 'broad scale' and expand their app interfaces. The initial technology under SmartDeviceLink is based on Ford's AppLink, which was released to the open source community back in February 2013. This open source project will be managed by Ford-owned Livio.
