

their contributions to open source in their CVs.

If you come to us, we offer jobs very quickly to those who are already active on GitHub and are contributing on some of the active projects. We look out for such enthusiastic people.

**Q Do you see open source as the future of computing?**

It is inevitable that this should happen. I see that the future of computing is certainly open source. There are so many developers, and all of them are employed by different companies which have several products in the market, but the same developers are also contributing to their own projects in their free time. So, eventually, because of the total number of developers contributing towards an open source solution, you actually have more production capacity in the open source world than you do in the proprietary world. So, on both accounts—coding and making a product—the open source solution will win out because it has more developers contributing over a longer period of time.

You can see this happen in most of the successful open source products. Linux is one of the major successes from the open source bouquet. It was started much after proprietary operating systems, but it caught up in a short span of time and then overtook the latter. Right now, we can say that the Linux operating system is far better than any proprietary counterpart,

whether it is Windows or Mac OS. It is substantially more secure and better than any popular commercial solution. Also, the platform maintains a wide community, and has a vast number of developers and contributors.

Apart from Linux, there is Apache Web Server that beats the proprietary option. Mozilla's Firefox is also a major example of open source success. Likewise, Android countered leaders such as BlackBerry OS and iOS with its powerful, community-focused features.

Thus, it is given that the future of computing and the IT world is all led by open source. Any proprietary solution available in today's market needs to have a much higher efficiency and effectiveness to overtake the growth of open source.

**Q What is your prediction for the Indian open source space?**

India will be the biggest powerhouse for open source in the world. One major factor is that we currently have many developers. In the West, open source has already succeeded. In India, it is in an interesting and exciting space, and people have realised that they have learnt a lot from it and that it has benefited their career. This has persuaded many Indian developers to enter this domain, and they are getting more and more involved with open source. So, India will dominate this field very soon.
