

"The automotive industry will increasingly focus on the specific functionality that owners want, such as comfort levels and entertainment. By providing this platform, Renault is paving the way for innovation in these areas," said Richard York, vice president of embedded marketing, ARM.

Qualcomm to help bring Meizu's Android offerings globally

Settling the existing patent disputes, Qualcomm has reached a patent-licensing agreement with China's Meizu. The latest development will help the chip maker expand its presence in the world of Android devices and take on Chinese competitors including MediaTek.

As per the terms of the agreement, Qualcomm has granted Meizu a worldwide royalty-bearing patent licence to develop, manufacture and sell devices with CDMA2000, WCDMA and 4G LTE technologies. The San Diego-headquartered company has assured that the latest partnership resolves all of its patent disputes with Meizu in China, Germany, France and the US. Besides, both the companies

are set to "take appropriate steps to terminate or withdraw" their patent infringement litigation and other invalidity proceedings.

"Qualcomm is pleased to sign this licence agreement with Meizu, and to help enhance Meizu's product line and generate strong growth for the company, both in China and globally," said Alex Roger, president, Qualcomm Technology Licensing, in a joint statement.

Based in southern China's Guangdong province, Meizu aims to counter home-grown players like OnePlus, Vivo and Xiaomi. The company already has plenty of Android running options in its portfolio that would now be expanded across the globe. This is likely to give the company a boost in the European and US markets.

"We are confident that this cooperation with Qualcomm will add tremendous value to our users, channels, shareholders and employees," stated Bai Yongxiang, president, Meizu.

With the latest deal, Qualcomm is reaching licensing agreements with as many as 10 of the largest Chinese smartphone companies. This demonstrates the domination of the chip maker in a market that once had Intel as an important player and has MediaTek as the next big name.

This latest development has emerged just a few weeks ahead of the Mobile World Congress (MWC) that will be held in Barcelona, Spain, in February 2017. Meizu is expected to unveil its Qualcomm Snapdragon-powered global offerings at this annual event.

Jove emerges as a replacement for Vim editor

Linux users already had some choices with regard to choosing an editor. But following the footsteps of Emacs, Jove has emerged the closest alternative to the iconic Vim editor.

Developed by open source contributor Jonathan Payne, Jove (Jonathan's Own Version of Emacs) is a small yet powerful Emacs version. It is capable of handling your day-to-day needs and comes with all built-in

features that were previously available on Emacs.

Red Hat upgrades CloudForms with enhanced cloud support

Red Hat is upgrading the abilities of its hybrid cloud management offerings through CloudForms 4.2. The latest version expands support for multiple cloud platforms.

The mix of physical, virtual and cloud environments with container and micro-services demands different capabilities. Red Hat has addressed most of these through CloudForms 4.2. Managing hybrid IT environments with Red Hat CloudForms is efficient and responsive. Also, organisations can save both time and costs by leveraging the significant improvements in the latest CloudForms.

Red Hat CloudForms 4.2 enables hybrid cloud management on Amazon Web Services (AWS)

through an Amazon EC2 image. The new release has enhanced the capabilities of OpenStack through improved tenant management as well as upgraded storage management for OpenStack objects. Likewise, there are improved chargeback capabilities for containers running on the Red Hat OpenShift Container Platform.

"There is no longer a 'one-size-fits-all' IT environment, as many organisations are seeking to leverage the best benefits of physical, virtual and cloud-based technologies.

Coupled with Linux containers, only managing one or two aspects of these hybrid computing environments can lead to downtime or outages," said Joe Fitzgerald, vice president of management, Red Hat, in a statement.

CloudForms is based on the open source ManageIQ project. This development supports a wide range of platforms and can be customised for niche industries or organisations.
