

- Runs multiple containers on multiple machines
- Easily moves between development, staging and production

The official website of Flocker is <https://clusterhq.com/flocker/introduction/>.

Powerstrip

Powerstrip, a new open source project from ClusterHQ, provides a useful platform for developers to build powerful Docker prototypes known as Powerstrip adapters. Multiple Powerstrip adapters can be integrated behind the familiar Docker CLI and API.

Figure 2: Powerstrip

For example, you can have a storage adapter like Flocker running alongside a networking adapter such as Weave, all playing well with the orchestration framework you choose.

Powerstrip is implemented as a configurable, pluggable, HTTP proxy for the Docker API, which lets users plug multiple Docker extension prototypes into the same Docker daemon.

Powerstrip allows you to build Docker extensions by implementing chained blocking webhooks triggered by arbitrary Docker API calls. The objective behind Powerstrip development is to make it possible for a rich ecosystem of tool builders to offer specialised services, without forcing end users to choose between different Docker experiences.

Helios

Helios, an open source Docker orchestration platform, helps developers in the deployment and management of containers

Figure 3: Helios

across a cluster of servers. It is equipped with an API based on HTTP as well as a command based client to connect to servers running Docker containers. Its key element is keeping track of event history, which includes varied information like Docker deployment, Docker restart and even updates or changes of any sort in the Docker version. <https://github.com/clusterhq/helios>
