

NEC establishes centre for Big Data and analytics in India

Japanese IT giant NEC Corporation has announced the launch of its Center of Excellence (CoE) in India to promote the adoption of Big Data and analytics solutions. Based in Noida, the new centre is the first by the company and is set to simplify digital transformation for clients across sectors such as telecom, retail, banking, financial services, retail and government.

NEC is set to invest US\$ 10 million over the next three years to achieve a revenue of US\$ 100 million in the next three years through the new CoE. While the Tokyo-headquartered company is initially targeting markets including Japan, India, Singapore, Philippines and Hong Kong, the centre will expand services throughout APAC and other regions.

"The new CoE is an important step towards utilising Big Data analytics and NEC's Data Platform for Hadoop to provide benefits for government bodies and enterprises in India and across the world," said Tomoyasu Nishimura, senior vice president, NEC Corporation.

NEC, in partnership with NEC India and NEC Technologies India (NTI), is leveraging Hadoop for its various Big Data and analytics developments. The company has implemented its hardware in partnership with Hortonworks and Red Hat.

"The latest CoE is designed as a single platform that can be used to cater to the needs of processing structured and unstructured data," Piyush Sinha, general manager for corporate planning and business management, NEC India, told *Open Source For You*.

Sinha is handling a team of around 20 people who are initiating operations through the new centre. However, NEC has plans to organise a 100-member professional team to address requirements in the near future. There are also plans to hire fresh talent to enhance Big Data developments.

The Data Platform for Hadoop (DPH) that NEC is using at the centre features a business intelligence layer in the background — alongside the Hadoop deployment, thus relieving customers of the chore of searching the individual building blocks of Big Data analytics. This combination also provides them the ability to generate value from the enormous pools of data.

NEC already has a record of contributing to national projects in the country. The company enabled the mass-level adoption of Aadhaar in partnership with the Unique Identification Authority of India (UIDAI) by providing a large-scale

GNOME 3.26 desktop to offer enhanced Disk Utility

While GNOME maintainers are gearing up with some major additions to the GNOME 3.26 desktop environment, the latest GNOME Disk Utility gives us a glimpse of the features that will enhance your experience.

GNOME 3.25.2 was published recently, and came with updated components as well as apps. That same release included the first development release of GNOME Disk Utility 3.26.

The new GNOME Disk Utility includes multiple mounting options along with an insensitive auto-clear switch for unused loop devices. Also, there are clearer options for encryption.

The GNOME team has additionally provided certain visual changes. The new GNOME Disk Utility version allows you to create an empty disk image from the App Menu. Similarly, the behaviour of the file system dialogue has been improved, and the UUID (Universally Unique Identifier) of selected volumes is displayed by default.

The update enables disk images to use MIME types. The disk mounting functionality in the software has been improved, and now has the ability to auto-clear the handling for *lock* and *unmount* buttons. Besides, the latest version prompts users while closing the app.

GNOME Disk Utility 3.25.2 is presently available for public testing. It will be released along with GNOME 3.26 later this year. Those wanting to try the preview version can download and compile GNOME Disk Utility 3.25.2 for their GNU/Linux distro.
