

4. Kendo UI

Developed by Telerik, Kendo UI is basically an HTML5 based mobile app development framework for developing hybrid mobile applications. It primarily makes use of jQuery and has over 70 jQuery widgets built-in. It has a simple UI for programming, a rock-solid data source, out-of-the-box themes, an MVVM framework, and a lot more. Kendo UI is an open source framework for developing Web and mobile apps.

Kendo UI Complete incorporates many products like Kendo UI Professional, as well as UIs for ASP.NET MVC, JSP and for PHP.

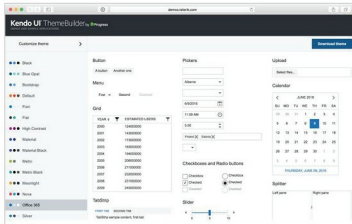

Figure 4: Kendo UI

Features

- Includes 70+ UI components like data grids, drop down menus, buttons to advanced components like Gantt Charts, spreadsheets, PivotGrid and Maps.
- Easy and powerful data binding to local and remote data, offline storage and support for popular Web services like REST and OData.
- Integrates and supports Angular JS directives.
- Integrates grid-layout frameworks like Bootstrap and Zurb Foundation for developing cross-platform Web apps customised to the desktop, phone and tablet.
- Easy to learn and use, and works with all the latest Web browsers.

Latest version: 2017 SP1

5. NativeScript

NativeScript is a powerful open source framework for developing Android and iOS apps. Mobile apps based on NativeScript are built using various programming languages like JavaScript and TypeScript. It directly supports the Angular JS framework. NativeScript is basically designed to allow developers to re-use significant amounts of code when switching between developing Web and mobile phone apps.

NativeScript and all the required plugins are installed using the package manager, npm. Projects are created, configured

and compiled via the command line. Platform independent user interfaces are defined using XML files. NativeScript then uses the abstractions described in the XML files to call the native elements of each platform. Application logic developed in Angular2 and TypeScript can be developed independent of the target platform as well. A NativeScript mobile application is built using the Node.js runtime and tooling.

Features

- Provides support for the development of robust and professional charts, calendars and graphs.
- Integrates XML for rich application development.
- Has full TypeScript support for .NET developers to enable them to use generics, enums, interfaces, static analysis and compile-time errors.
- Developers can choose their own architecture to use either JavaScript, TypeScript or Angular based application development.

Latest version: 3.0

6. Onsen UI

Onsen UI is an open source framework for HTML5 based hybrid mobile app development based on PhoneGap/ Cordova. It is also compatible with Angular and jQuery. Onsen UI provides a comprehensive set of Web-based UI components and features like a two-column view of tables and material design for unique app development. It also has a drag-and-drop GUI tool which is under development at Tokyo-based Asial, which has also developed Monaca.

Features:

- Fastest platform to develop HTML5 based hybrid mobile apps using JavaScript, HTML and CSS and also in making real-time use of Cordova.
- Has tools like a powerful CLI and LocalKit to perform debugging tasks.
- Support for Android Material Design with automatic styling, including full support for making rich quality iOS apps.
