

biometrics identification system. It is also supporting the Delhi-Mumbai Industrial Corridor (DMIC) that tracks nearly 70 per cent of container transactions in India.

Krita painting app enhances experience for GIMP files

Krita, the open source digital painting app, has announced v3.1.4. The new version is especially designed to deliver an enhanced experience for GIMP files.

Krita 3.1.3 was released in early May. And now, it's already time for the new release. The new minor update has improved the loading time of GIMP 2.9 files. The file format used to crash while attempting to quickly cycle through layers that contained a colour tag.

It is worth noting that the GIMP 2.9 file format is not officially supported by

Krita. Nevertheless, its development team has fixed the crashing issue in v3.1.4.

With the new version of Krita, you can no longer hide the template selector in the 'New Image' dialogue box. But the menu entries in the macro recorder plugin in Krita are still visible. However, you can expect them to be removed in subsequent updates.

Krita 3.1.4 also has a patch for the crash that occurs while attempting to play an animation with the OpenGL option active.

Among the list of other minor bug fixes, Krita has fixed a crash that could occur during closing the last view on the last document. Krita 3.1.4 also improves rendering of animation frames.

Krita 3.1.4 with its bug fixes is a stability release that is a recommended update for all users. The latest version is available for Linux, Windows and MacOS on the official website.

Happiest Minds enters open source world by acquiring OSSCube

Happiest Minds Technologies, a Bengaluru-headquartered emerging IT company, has acquired US-based digital transformation entity OSSCube. The new

development is aimed to help the Indian company enter the market of enterprise open source solutions and expand its presence in the US.

With the latest deal, Happiest Minds is set to widen its portfolio of digital offerings and strengthen its business in

North America, the market that OSSCube is focused on. The team of 240 from OSSCube will now be a part of Happiest Minds. The acquisition will bring the total workforce of Happiest Minds to 2,400 and its active customer base to 170.

"We are delighted to welcome the OSSCube team into the Happiest Minds family," said Ashok Soota, executive chairman, Happiest Minds, in a joint statement.

Founded in 2008 by Indian entrepreneurs Lavanya Rastogi and Vineet Agarwal, OSSCube is one of the leading open source companies around the globe. It is an exclusive enterprise partner for the open source platform Pimcore in North America. Apart from the open source developments, the company recently expanded the verticals it operates in to include the cloud, Big Data, e-commerce and enterprise mobility.

"Coming together with Happiest Minds offers us the scale, global reach, complementary skills and expertise, enabling us to offer ever more innovative solutions to our global customers. We believe that the great cultural fit,

Google Photos gets AI integration to archive users' pictures

Google Photos has been enhanced with an all-new AI-powered upgrade that suggests which trivial pictures from your collection should be archived. The latest development is a part of the Google Assistant support.

The option to archive unwanted photos from your timeline is indeed welcome, in order to make your albums clutter-free. But what is more interesting is the artificial intelligence (AI) that Google has used to deliver this feature.

You might have a mixed collection of your pictures that include various memorable moments alongside some images that you no longer need. These could be photographs of documents, billboards or posters. The new AI integration within Google Photos detects the difference intelligently, while the Assistant tab helps you select the not-so-important ones for archiving.

"You can review the suggestions and remove any photos you don't want archived, and tap to confirm when you are done," the Google Photos team wrote in a Google+ post, explaining the latest feature. Once archived, you can view those unimportant pictures in the 'Archive' tab.

Google has started rolling out the new feature to Android, iOS and desktop versions of the Photos app. Going forward, the machine learning input powering the archiving feature is likely to be available to developers to test its effectiveness across new areas.
