7. React Native

React Native is an open source spin off of Facebook's React JavaScript framework, which famously replaced the earlier HTML5 Foundation. As the name suggests, this high-end, iOS-focused program is more of a native app package than a cross-platform framework. But with its new Android support, it loosely fits our requirements, as you can essentially write once in JavaScript and port to both platforms. Currently, only OS X desktops are fully supported, although there are experimental Linux and Windows versions for Android development.

Features:

- Full integration and strong platform support for developing Android and iOS apps. Facebook used React Native to build its own App Manager app, both for Android and iOS platforms.
- React Native's building blocks are reusable 'native components' that compile directly to it.
- It is easy to incorporate React Native components into applications code.
- React Native is more UI focused, making it more like a JavaScript library rather than being a simple framework.
- Enables efficient app development and has strong support for third party plugins, in addition to less memory utilisation.

Latest version: 0.43

8. Intel XDK

Intel XDK allows you to build cross-platform apps for each and every tool. It includes Web services and plugins for content-

rich, interactive and responsive apps that run on any device. This framework offers a complete range of tools that support development, emulation, testing, debugging and publishing. Recently, the developers made some big changes by supporting all the capabilities like developing mobile HTML5 apps (including Apache Cordova) for Android, iOS and Windows 10 UAP. They have now included software development capabilities for Node.js-based, on-board, IoT apps too.

Intel XDK provides a live preview of the app on the connected device while you are developing it, along with many other useful tools. You can create apps using a drag-and-drop approach, although this does create a lot of unnecessary code.

Figure 8: Intel XDK user interface

Features:

- Code hinting, code completion, emulator and device testing via Intel App Preview Mobile app.
- Cordova and third party plugins support, as well as support for template and expanded device APIs.
- Drag-and-drop UI layout builder, one-click store deployment and remote server compiling.
