

The Best Open Source Mobile App Development Frameworks

Have you ever imagined a day without your mobile (rather, smart mobile) phone? Probably not, since mobile applications have now become part and parcel of our lives. Read on to learn more about the popular mobile app development languages and frameworks.

If we flash back to 1973, when Martin Cooper and John F. Mitchell of Motorola came up with the first mobile phone they probably never dreamt that their invention would one day become such an essential part of everyone's life. As we traverse from 3G to 4G and now inch towards 5G, our mobile phones have become smarter and smarter. So what is it that makes them smarter? We will all agree that it is the wide range of applications on our mobile phones that should be given the credit for this.

According to Statista, a Germany-headquartered portal for market research, statistics and business intelligence, as of March 2017, Android mobile users can now choose from as many as 2.8 million mobile apps in the Google Play store, while iOS users have as many as 2.2 million mobile applications available in Apple's App store for their use. Many everyday tasks are now performed with the help of a mobile app.

A mobile application is just software designed to run on different mobile devices or tablets. The saga of mobile

app development began in 1998 with Snake—the first mobile app that came as a standard preloaded game in Nokia mobile phones. Since then, we have made many giant leaps forward. In fact, most Web apps are now switching to mobile versions because of the tremendous increase in the number of smartphone users. People find their smartphones handier and more compact as compared to laptops or desktops. A mobile app gives developers the power to put their product directly in the hands of the user. All this has led to a sudden surge in the development of various mobile applications. Google came up with the Google Play store (earlier Android Market) in October 2008, and it now supports around 493 million downloads all across the globe on a daily basis. Since India is going digital at a super speed, this again offers tremendous opportunities to develop different mobile applications. Just after demonetisation, BHIM, Paytm and other such online payment applications were adopted widely.

Mobile application developers really need to look into all the possible glitches that could arise when the app is in
