

Assuming that you have created your GitHub account, log in and visit the JetBrains repository. Click the 'Fork' button on the top right side of the screen and select your repository as the option (if you have multiple organisations as options, don't worry; just select your personal page). If it doesn't show your personal page, you probably already have a copy of it forked on your page (Figure 5).

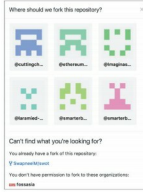

Figure 5: Forking your copy of a repository

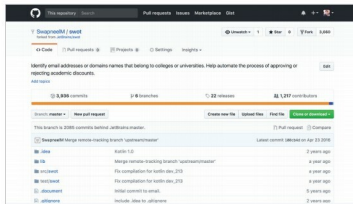

Figure 6: The forked copy you created

Now, visit your copy of the repository and make the changes in the code as per the instructions in the *README.md* file. Add your institution domain name as per the folder structure described. Use the UI to create a new file with the name of your institution.

For instance, I've added mine as *lib/domains/in/edu/djsce.txt* since my college email address is *www.djsce.edu.in*. It contains the name of my institution (Figure 6).

Once you're done, it is time to merge this updated code back into the master branch! Go to the 'Pull Requests' section. Now, since we have forked the code, the procedure to merge it back is known as creating a 'pull request'. Essentially, we request the master branch to 'pull' our changes back into it. It will ask you to add a description and name for the edit or 'commit' that you're providing. Once you have created one, it will show up on the JetBrains repository like the other edits/commits there (Figure 8).

Now, since you don't own the JetBrains repository, you need to wait for the admins to approve your pull request. Once it's been merged, it will appear to be something like what's shown in Figure 9.

And that's it. Congratulations, you are now an open source contributor!

Because of you, every student at your institute can now request a JetBrains student discount using their university's email address. You may now feel awesome for helping generations of students at your institute with just ten minutes worth of effort; keep at it!

You can also contribute towards addressing the 'Issues' on various repositories. Most of them have issues reserved for beginners or those labelled 'first-timers only'. There are also websites like *MunGell's list of Awesome Beginner Projects* and *Up For Grabs* that will help you get started on submitting your first pull request. [END](https://github.com)
