

are tracking you and we don't want to block some innocent ads that help the creators run their websites. Moreover, tracking elements don't always come as part of ads. Privacy Badger targets trackers regardless of their relationship with ads, which is a behaviour that requires additional configuration in regular ad blockers.

The Do Not Track header

Do Not Track (DNT) is a proposed HTTP header field that tells a website that you wouldn't like to be tracked. Firefox's Private Mode has this feature enabled, by default, whereas Chromium does not. You can enable this feature even in the regular mode by visiting the privacy and security sections of your browser's settings page, if it supports it.

To know more and to check your browser, visit allaboutdnt.com (not from EFF).

HTTPS Everywhere

We all know that HTTPS is a mechanism that helps us encrypt our communication with Web servers, making it impossible for eavesdroppers to tap or manipulate our data. The URLs of HTTPS-enabled pages start with <https://> instead of <http://>.

However, not all websites use HTTPS. And among the ones that are HTTPS-enabled, not all enforce it. This means you might be at risk even if you are visiting an HTTPS-enabled website, but have forgotten to ensure that your address bar shows <https://> instead of <http://>. Another unfair practice is websites loading some third-party or additional resources over HTTP, even if the whole page's address starts with <https://> (some browsers display a broken lock icon to indicate this).

The HTTPS Everywhere extension helps you in such situations by rewriting the HTTP requests from your browser with HTTPS, if the servers support it. Of course, it can't make a

website HTTPS-enabled if the server doesn't have an SSL/TLS certificate installed or it intentionally disables HTTPS for certain pages. Then what is the use of such an extension, you might ask. But recall the fact that not all HTTPS-enabled sites default to it, and not all secure pages are 100 per cent secure since they load non-HTTPS elements also. This is where HTTPS Everywhere can be of some help and it really matters.

You can download this extension from eff.org/https-everywhere. It is worth noting that the Tor Project has also contributed to it.

What about the sites that don't support HTTPS yet? Tell the webmasters how important HTTPS is, and how it can improve their reputation. Webmasters can get *Let's Encrypt* SSL/TLS certificates for free, just by installing the EFF tool *Certbot* (certbot.eff.org). If you are a webmaster who hasn't got HTTPS yet, take action quickly!

More from EFF

If you are interested to learn more about Internet privacy, visit eff.org/pages/tools where the organisation showcases its privacy resources. The list includes *Surveillance Self-Defence* (ssd.eff.org), a portal that highlights how you lose your privacy online, and how to protect it by following some step-by-step instructions.

You can also visit emailselfdefense.fsf.org, to learn everything you should know about e-mail encryption.
