

Sign Up with Ubidots to Power Your IoT App

Ubidots is a hosted IoT platform in the cloud that can help to jumpstart your IoT application. It was created in a startup accelerator, and has since powered hundreds of IoT applications across multiple sectors like healthcare, energy, etc., in more than 40 countries.

In this article, we will take a look at the Ubidots platform and understand the process of signing up, ingesting our sensor data into the platform and visualising it.

Features

The platform is available as a service and offers the following features:

- APIs to ingest your sensor data from any device.
- Support for both HTTP and MQTT protocols for data ingestion.
- Dashboards to help you visualise your IoT data.
- Alerts for your users/applications based on your sensor data.
- Integration with more than 20 devices (Adafruit, Arduino, Particle, Tessel and others) to help jumpstart moving your IoT data to the Ubidots platform.
- Free to get started with education and business pricing plans, based on your requirements.

Getting started

The first step in using the Ubidot platform is to sign up for its service. Signing up is free and provides you with the 'Education plan', which is sufficient to get started on small projects or proof-of-concept applications. The signup page is located at <https://app.ubidots.com/accounts/signup/> and after successfully signing up, you will head to the Ubidots home page, where you can see that you have been provided 5000 credits to use. We will refer to this home page as the Web portal.

Obtaining the Ubidots API Token

One of the important things to do upfront is to note down your API token. This will be required later in the article when we use the HTTP API as a primary mechanism to ingest our sensor data into the Ubidots platform. The API token is available when you click on your account name on the top right corner of the Web portal and then on the API
