

Figure 1: Firebase dashboard

- see the screen shown in Figure 1.
6. Click on 'Create New Project'.
7. Give the name of the project and specify the country/region, as shown in Figure 2.
8. Once your project is created, you will see the dashboard of your application. It will be similar to that displayed in Figure 3.
9. Now select *Database* from the left-hand palette and then 'Rules' from the next page, which will display something like what's shown in Figure 4.
10. This time, we want to give all users access of the database; hence, we need to change the rules. You can manually do this by typing values as shown in Figure 5. Once done, click on the *Publish* button.

So you have now successfully created an empty space for your project in the Firebase database, and given read and write permissions to all the users who have the URL.

If you are new to this Android journey, do go through a few of the articles in this series, targeted at beginners, to familiarise yourself with App Inventor.

GUI requirements

For every application, we have a graphical user interface or GUI, which helps the user to interact with the on-screen components. How each component responds to user actions is defined in the block editor section. In

Figure 2: Create a new project

Figure 3: Demo project in the Firebase dashboard

Figure 4: Reading and writing rules with authentication

Figure 5: Rules with read and write permissions

this application, we will have multiple screens and will define the look and feel for each of them.

There are two GUI screens and their names are:

1. Screen1
2. StudentAddScreen

GUI requirements for Screen1

1. **Label:** Labels are the static text components which are used to display some headings or markings on the screen.
2. **Button:** A button will let you trigger the event and is a very essential component.
