

am providing the complete code as barcode. Scan QRCode 1 given below to obtain the '.aia' file, which you can upload to your projects in the App Inventor 2 and view the complete code.

- If you want to see how the application looks after installation, scan QRCode 2 to get the application .apk.

Now you are done with the block editor too. Next, let's download and install the app on your phone to check how it is working. Figure 12 gives the database view.

Packaging and testing

To test the app, you need to get it on your phone. First, you have to download the application to your computer and then move it to your phone via Bluetooth or USB cable. I'll tell you how to download it.

1. On the top row, click on the 'Build' button. It will show you the option to download the *apk* to your computer.
2. The progress of the downloading can be seen and once that's successful, the application will be placed in the *Download* folder of your directory or the preferred

- location you have set for it.
3. Now you need to get this *apk* file to your mobile phone either via Bluetooth or USB cable.

Once you have placed the *apk* file on your SD card, you need to install it. Follow the on-screen instructions to install it. You might get some notification or warning saying, 'Install from untrusted source'. Allow this from the settings and after successful installation you will see the icon of your application in the menu of your mobile. What you see is the default icon, which can be changed and I will tell you how to do this as we move ahead in this course.

I hope your application is working exactly as per your requirements. Now, depending upon your usage requirements, you can customise various things like the image, sound and behaviour, too.

Debugging the application

We have just created the prototype of the application with very basic functionality, but what else might the user be interested in? Now consider various use cases that you might be required to address so as not to annoy the user. Your app should be able to handle the following use cases:

1. Wouldn't it be good to add an option to delete a student's name from the list?
2. How about pulling the attendance records within the application and generating a dashboard?
3. Can we make student profiles more attractive by adding profile photos and other related details?

These are some of the scenarios that might occur and users will be pretty happy if your app handles such situations. Think about all the ways your app can integrate features to address these scenarios. Do ask me if you fail to address any of the above cases.

You have successfully built another useful Android app for yourself. Happy inventing!

A note to readers: Dear readers, I would like to know more about your interests and ideas on making Android applications. If you have any specific ideas that you want me to write about, do send me an email. I will surely try to help you convert your idea into a working application.
